

Probabilistic Robotics

SLAM

1

The SLAM Problem

SLAM is the process by which a robot **builds a map** of the environment and, at the same time, uses this map to **compute its location**

- **Localization:** inferring location given a map
- **Mapping:** inferring a map given a location
- **SLAM:** learning a map and locating the robot simultaneously

2

2

The SLAM Problem

- SLAM is a **chicken-or-egg problem**:
 - A map is needed for localizing a robot
 - A pose estimate is needed to build a map
- Thus, SLAM is (regarded as) a **hard problem** in robotics

3

The SLAM Problem

- SLAM is considered **one of the most fundamental problems** for robots to become truly autonomous
- A variety of different approaches to address the SLAM problem have been presented
- **Probabilistic methods** rule
- History of SLAM dates back to the **mid-eighties** (stone-age of mobile robotics)

4

The SLAM Problem

Given:

- The robot's controls

$$\mathbf{U}_{0:k} = \{\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_k\}$$

- Relative observations

$$\mathbf{Z}_{0:k} = \{\mathbf{z}_1, \mathbf{z}_2, \dots, \mathbf{z}_k\}$$

Wanted:

- Map of features

$$\mathbf{m} = \{\mathbf{m}_1, \mathbf{m}_2, \dots, \mathbf{m}_n\}$$

- Path of the robot

$$\mathbf{X}_{0:k} = \{\mathbf{x}_0, \mathbf{x}_1, \dots, \mathbf{x}_k\}$$

5

5

Structure of the Landmark-based SLAM-Problem

6

6

SLAM Applications

7

7

Representations

- Grid maps or scans

[Lu & Milios, 97; Gutmann, 98; Thrun 98; Burgard, 99; Konolige & Gutmann, 00; Thrun, 00; Arras, 99; Haehnel, 01;...]

- Landmark-based

[Leonard et al., 98; Castelanos et al., 99; Dissanayake et al., 2001; Montemerlo et al., 2002;...]

8

8

9

9

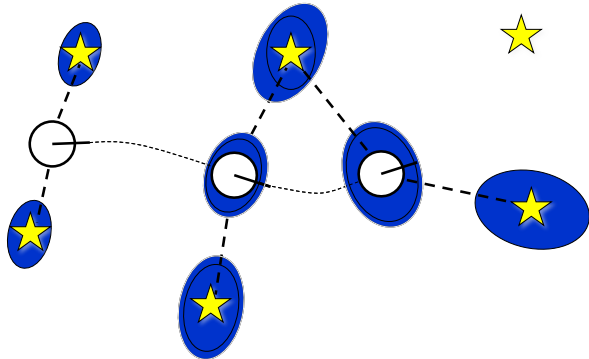

10

10

Why is SLAM a hard problem?

SLAM: robot path and map are both **unknown**

Robot path error correlates errors in the map

11

11

Why is SLAM a hard problem?

- In the real world, the mapping between observations and landmarks is unknown
- Picking wrong data associations can have catastrophic consequences
- Pose error correlates data associations

12

12

SLAM: Simultaneous Localization and Mapping

- Full SLAM: Estimates entire path and map!

$$p(x_{1:t}, m | z_{1:t}, u_{1:t})$$

- Online SLAM:

$$p(x_t, m | z_{1:t}, u_{1:t}) = \int \dots \int p(x_{1:t}, m | z_{1:t}, u_{1:t}) dx_1 dx_2 \dots dx_{t-1}$$

Integrations (marginalization) typically done one at a time

Estimates most recent pose and map!

13

13

Graphical Model of Full SLAM:

$$p(x_{1:t}, m | z_{1:t}, u_{1:t})$$

14

14

Graphical Model of Online SLAM:

$$p(x_t, m | z_{1:t}, u_{1:t}) = \int \int \dots \int p(x_{1:t}, m | z_{1:t}, u_{1:t}) dx_1 dx_2 \dots dx_{t-1}$$

15

15

Graphical Model: Models

16

16

Techniques for Generating Consistent Maps

- Scan matching
- EKF SLAM
- Fast-SLAM
- Probabilistic mapping with a single map and a posterior about poses
Mapping + Localization
- Graph-SLAM, SEIFs

17

17

Scan Matching

Maximize the likelihood of the i-th pose and map relative to the (i-1)-th pose and map.

$$\hat{x}_t = \arg \max_{x_t} \left\{ p(z_t | x_t, \hat{m}^{[t-1]}) \cdot p(x_t | u_{t-1}, \hat{x}_{t-1}) \right\}$$

current measurement map constructed so far robot motion

Calculate the map $\hat{m}^{[t]}$ according to “mapping with known poses” based on the poses and observations.

18

18

Kalman Filter Algorithm

1. Algorithm **Kalman_filter**(μ_{t-1} , Σ_{t-1} , u_t , z_t):
2. Prediction:
3. $\bar{\mu}_t = A_t \mu_{t-1} + B_t u_t$
4. $\bar{\Sigma}_t = A_t \Sigma_{t-1} A_t^T + R_t$
5. Correction:
6. $K_t = \bar{\Sigma}_t C_t^T (C_t \bar{\Sigma}_t C_t^T + Q_t)^{-1}$
7. $\mu_t = \bar{\mu}_t + K_t (z_t - C_t \bar{\mu}_t)$
8. $\Sigma_t = (I - K_t C_t) \bar{\Sigma}_t$
9. Return μ_t , Σ_t

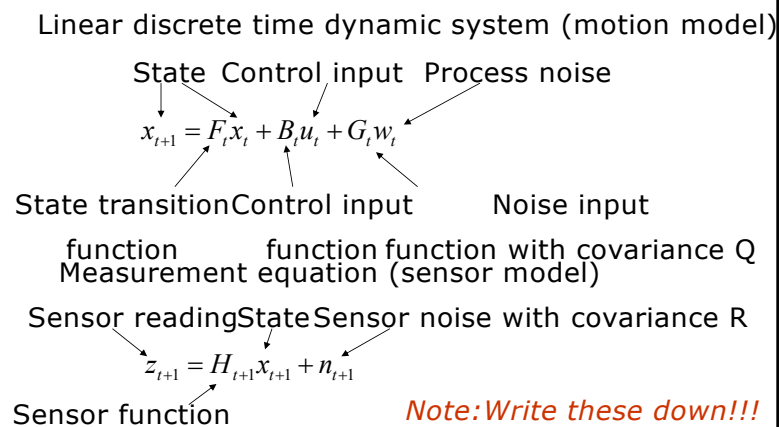

19

Extended Kalman Filter

- Previously Extended Kalman Filter line features detected from range data
- Now review extended Kalman Filter for landmark model
- Digression – (with slightly different notation)

20

Kalman Filter Components (also known as: Way Too Many Variables...)

21

At last! The Kalman Filter...

Propagation (motion model):

$$\hat{x}_{t+1/t} = F_t \hat{x}_{t/t} + B_t u_t$$

$$P_{t+1/t} = F_t P_{t/t} F_t^T + G_t Q_t G_t^T$$

Update (sensor model):

$$\hat{z}_{t+1} = H_{t+1} \hat{x}_{t+1/t}$$

$$r_{t+1} = z_{t+1} - \hat{z}_{t+1}$$

$$S_{t+1} = H_{t+1} P_{t+1/t} H_{t+1}^T + R_{t+1}$$

$$K_{t+1} = P_{t+1/t} H_{t+1}^T S_{t+1}^{-1}$$

$$\hat{x}_{t+1/t+1} = \hat{x}_{t+1/t} + K_{t+1} r_{t+1}$$

$$P_{t+1/t+1} = P_{t+1/t} - P_{t+1/t} H_{t+1}^T S_{t+1}^{-1} H_{t+1} P_{t+1/t}$$

22

In words ...

Propagation (motion model):

$$\hat{x}_{t+1/t} = F_t \hat{x}_{t/t} + B_t u_t$$

$$P_{t+1/t} = F_t P_{t/t} F_t^T + G_t Q_t G_t^T$$

- State estimate is updated from system dynamics
- Uncertainty estimate *GROWS*

Update (sensor model):

$$\hat{z}_{t+1} = H_{t+1} \hat{x}_{t+1/t}$$

$$r_{t+1} = z_{t+1} - \hat{z}_{t+1}$$

$$S_{t+1} = H_{t+1} P_{t+1/t} H_{t+1}^T + R_{t+1}$$

$$K_{t+1} = P_{t+1/t} H_{t+1}^T S_{t+1}^{-1}$$

$$\hat{x}_{t+1/t+1} = \hat{x}_{t+1/t} + K_{t+1} r_{t+1}$$

$$P_{t+1/t+1} = P_{t+1/t} - P_{t+1/t} H_{t+1}^T S_{t+1}^{-1} H_{t+1} P_{t+1/t}$$

- Compute expected value of sensor reading
- Compute the difference between expected and "true"
- Compute covariance of sensor reading
- Compute the Kalman Gain (how much to correct est.)
- Multiply residual times gain to correct state estimate
- Uncertainty estimate *SHRINKS*

23

Linearized Motion Model for a Robot

From a robot-centric perspective, the velocities look like this:

$$\begin{aligned} \dot{x}_t &= V_t \\ \dot{y}_t &= 0 \\ \dot{\phi}_t &= \omega_t \end{aligned}$$

From the global perspective, the velocities look like this:

$$\begin{aligned} \dot{x}_t &= V_t \cos \phi_t \\ \dot{y}_t &= V_t \sin \phi_t \\ \dot{\phi}_t &= \omega_t \end{aligned}$$

The discrete time state estimate (including noise) looks like this:

$$\hat{x}_{t+1} = \hat{x}_t + (V_t + w_{V_x}) \delta t \cos \hat{\phi}_t$$

$$\hat{y}_{t+1} = \hat{y}_t + (V_t + w_{V_y}) \delta t \sin \hat{\phi}_t$$

$$\hat{\phi}_{t+1} = \hat{\phi}_t + (\omega_t + w_{\omega}) \delta t$$

Problem! We don't know linear and rotational velocity errors. The state estimate will rapidly diverge if this is the only source of information!

24

Linearized Motion Model for a Robot

Now, we have to compute the covariance matrix Propagation equations.

The indirect Kalman filter derives the pose equations from the estimated error:

$$\begin{aligned}x_{t+1} - \hat{x}_{t+1} &= \tilde{x}_{t+1} \\y_{t+1} - \hat{y}_{t+1} &= \tilde{y}_{t+1} \\ \phi_{t+1} - \hat{\phi}_{t+1} &= \tilde{\phi}_{t+1}\end{aligned}$$

In order to linearize the system, the following small-angle assumptions are made:

$$\begin{aligned}\cos \tilde{\phi} &\cong 1 \\ \sin \tilde{\phi} &\cong \tilde{\phi}\end{aligned}$$

25

Linearized Motion Model for a Robot

From the error-state propagation equation, we can obtain the State propagation and noise input functions F and G :

$$\begin{bmatrix} \tilde{x}_{t+1} \\ \tilde{y}_{t+1} \\ \tilde{\phi}_{t+1} \end{bmatrix} = \begin{bmatrix} 1 & 0 & -V_m \delta \sin \hat{\phi} \\ 0 & 1 & V_m \delta \cos \hat{\phi} \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \tilde{x}_t \\ \tilde{y}_t \\ \tilde{\phi}_t \end{bmatrix} + \begin{bmatrix} -\delta \cos \phi_R & 0 \\ -\delta \sin \phi_R & 0 \\ 0 & -\delta \end{bmatrix} \begin{bmatrix} w_{V_t} \\ w_{\phi_t} \end{bmatrix}$$

$$\tilde{X}_{t+1} = F_t \tilde{X}_t + G_t W_t$$

From these values, we can easily compute the standard covariance propagation equation:

$$P_{t+1/t} = F_t P_{t/t} F_t^T + G_t Q_t G_t^T$$

26

Sensor Model for a Robot with a Perfect Map

From the robot, the measurement looks like this:

$$z_{t+1} = \begin{bmatrix} x_{L_{t+1}} \\ y_{L_{t+1}} \\ \phi_{L_{t+1}} \end{bmatrix} + \begin{bmatrix} n_x \\ n_y \\ n_\phi \end{bmatrix}$$

From a global perspective, the measurement looks like:

$$z_{t+1} = \begin{bmatrix} \cos \phi_{t+1} & -\sin \phi_{t+1} & 0 \\ \sin \phi_{t+1} & \cos \phi_{t+1} & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_{L_{t+1}} - x_{t+1} \\ y_{L_{t+1}} - y_{t+1} \\ \phi_{L_{t+1}} - \phi_{t+1} \end{bmatrix} + \begin{bmatrix} n_x \\ n_y \\ n_\phi \end{bmatrix}$$

The measurement equation is nonlinear and must also be linearized!

27

Sensor Model for a Robot with a Perfect Map

Now, we have to compute the linearized sensor function.

Once again, we make use of the indirect Kalman filter where the error in the reading must be estimated.

In order to linearize the system, the following small-angle assumptions are made:

$$\cos \tilde{\phi} \cong 1$$

$$\sin \tilde{\phi} \cong \tilde{\phi}$$

The final expression for the error in the sensor reading is:

$$\begin{bmatrix} \tilde{x}_{L_{t+1}} \\ \tilde{y}_{L_{t+1}} \\ \tilde{\phi}_{L_{t+1}} \end{bmatrix} = \begin{bmatrix} -\cos \hat{\phi}_{t+1} & -\sin \hat{\phi}_{t+1} & -\sin \hat{\phi}_{t+1} (x_L - \hat{x}_{t+1}) + \cos \hat{\phi}_{t+1} (y_L - \hat{y}_{t+1}) \\ \sin \hat{\phi}_{t+1} & -\cos \hat{\phi}_{t+1} & -\cos \hat{\phi}_{t+1} (x_L - \hat{x}_{t+1}) - \sin \hat{\phi}_{t+1} (y_L - \hat{y}_{t+1}) \\ 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} \tilde{x}_{t+1} \\ \tilde{y}_{t+1} \\ \tilde{\phi}_{t+1} \end{bmatrix} + \begin{bmatrix} n_x \\ n_y \\ n_\phi \end{bmatrix}$$

28

- end of digression

29

EKF SLAM: State representation

- **Localization**

3x1 pose vector $\mathbf{x}_k = \begin{bmatrix} x_k \\ y_k \\ \theta_k \end{bmatrix}$ 3x3 cov. matrix $C_k = \begin{bmatrix} \sigma_x^2 & \sigma_{xy} & \sigma_{x\theta} \\ \sigma_{yx} & \sigma_y^2 & \sigma_{y\theta} \\ \sigma_{\theta x} & \sigma_{\theta y} & \sigma_\theta^2 \end{bmatrix}$

- **SLAM**

Landmarks are **simply added** to the state.

Growing state vector and covariance matrix!

$$\mathbf{x}_k = \begin{bmatrix} \mathbf{x}_R \\ \mathbf{m}_1 \\ \mathbf{m}_2 \\ \vdots \\ \mathbf{m}_n \end{bmatrix}_k \quad C_k = \begin{bmatrix} C_R & C_{RM_1} & C_{RM_2} & \cdots & C_{RM_n} \\ C_{M_1R} & C_{M_1} & C_{M_1M_2} & \cdots & C_{M_1M_n} \\ C_{M_2R} & C_{M_2M_1} & C_{M_2} & \cdots & C_{M_2M_n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ C_{M_nR} & C_{M_nM_1} & C_{M_nM_2} & \cdots & C_{M_n} \end{bmatrix}_k$$

30

(E)KF-SLAM

- Map with N landmarks: (3+2N)-dimensional Gaussian

$$Bel(x_t, m_t) = \left(\begin{array}{c|ccc|ccc} x & \sigma_x^2 & \sigma_{xy} & \sigma_{x\theta} & \sigma_{xl_1} & \sigma_{xl_2} & \dots & \sigma_{xl_N} \\ y & \sigma_{xy} & \sigma_y^2 & \sigma_{y\theta} & \sigma_{yl_1} & \sigma_{yl_2} & \dots & \sigma_{yl_N} \\ \theta & \sigma_{x\theta} & \sigma_{y\theta} & \sigma_\theta^2 & \sigma_{\theta l_1} & \sigma_{\theta l_2} & \dots & \sigma_{\theta l_N} \\ \hline l_1 & \sigma_{xl_1} & \sigma_{yl_1} & \sigma_{\theta l_1} & \sigma_{l_1}^2 & \sigma_{l_1 l_2} & \dots & \sigma_{l_1 l_N} \\ l_2 & \sigma_{xl_2} & \sigma_{yl_2} & \sigma_{\theta l_2} & \sigma_{l_1 l_2} & \sigma_{l_2}^2 & \dots & \sigma_{l_2 l_N} \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ l_N & \sigma_{xl_N} & \sigma_{yl_N} & \sigma_{\theta l_N} & \sigma_{l_1 l_N} & \sigma_{l_2 l_N} & \dots & \sigma_{l_N}^2 \end{array} \right)$$

- Can handle hundreds of dimensions

Approximations for SLAM

- Local submaps
[Leonard et al.99, Bosse et al. 02, Newman et al. 03]
- Sparse links (correlations)
[Lu & Milios 97, Guivant & Nebot 01]
- Sparse extended information filters
[Frese et al. 01, Thrun et al. 02]
- Thin junction tree filters
[Paskin 03]
- Rao-Blackwellisation (FastSLAM)
[Murphy 99, Montemerlo et al. 02, Eliazar et al. 03, Haehnel et al. 03]

53

53

EKF-SLAM Summary

- Quadratic in the number of landmarks: $O(n^2)$
- Convergence results for the linear case.
- Can **diverge** if nonlinearities are large!
- Have been applied successfully in large-scale environments.
- Approximations reduce the computational complexity.

55

55

Graph SLAM

- Full SLAM Technique
- Generates probabilistic links
- Computes map only occasionally

56

56

Graph SLAM

57

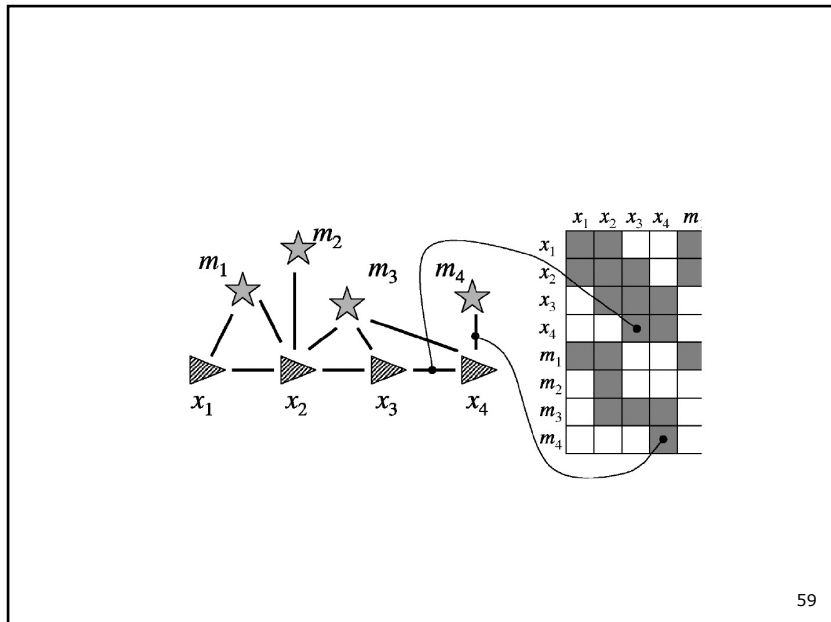

57

Graph SLAM

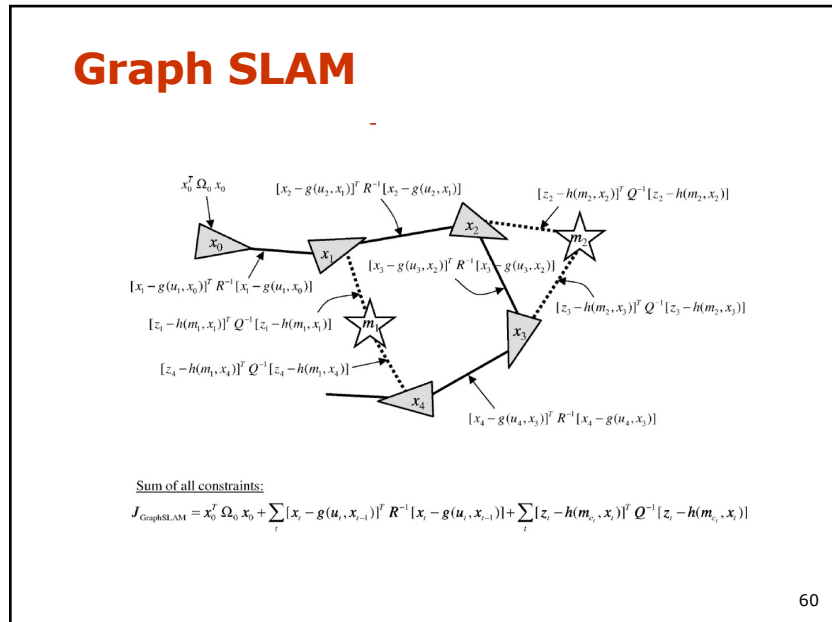

58

58

59

60

Graph SLAM

- Use scan patches to detect loop closure
- Add new position constraints
- Deform the network based on covariances of matches

Before loop closure

After loop closure

61

61

Graph SLAM

- Full SLAM – with loop closure
- Constructs link graph between poses and landmarks
- Graph is sparse number of edges is linear in number of nodes
- Build information matrix and vector in linearized form
- Map recovered by reduction to robot poses, followed by conversion to moment representation, followed by estimation of landmark positions
- ML estimate by minimization of $J_{graphSLAM}$

Examples of outdoor mapping 10^8 features 10^3 poses

62

62
