# CS633 Lecture 02 Line Segments Intersection 

Jyh-Ming Lien<br>Dept of Computer Science<br>George Mason University

Based on Chapter 2 of the textbook and Ming Lin's lecture note at UNC

## Line Segments Intersection

- Driving Applications
- Geographic information system:
- the "Map overlay" problems

- Computer Graphics:
- Polygon intersection
- 3D Morphing
- Modeling:
- Polygonal Boolean operations
(Constructive Solid Geometry or CSG)

## Application 1 Thematic Map Overlay

- GISs split each map into several layers
- Each layer is called a thematic map
- storing one type of information
- Find overlay of several maps to locate interesting junctions
- Line/curve intersections
- Region overlapping
- Point location

## Transform to a Geometric Problem

## GIS

Finding the overlay of two maps

- Curves can be approximated by small (line) segments
- Each thematic map can be viewed as a collection of line segments

Computational Geometry computing all intersection points between the line segments of two sets
 further

Make 2 sets into 1. But, how do we identify the real intersections?

## Line Segments Intersection

- Problem: Given a set of line segments
- Output: Intersections and for each intersection output the intersecting segments.

## Problem Analysis

- Brute Force Approach: $\mathrm{O}\left(n^{2}\right)$
- Is this the lower bound of the problem?
- Is this good for our problem? Why?
- Even there are no intersections, we will spend $\mathrm{O}\left(n^{2}\right)$ time
- Desiderata: output (intersection) sensitive
- Observation: Segments that are close together are the candidates for intersection
- How do you determine two segments that are close or far away???
- Can the distance of two segments tell you anything?

## Closeness of Segments

- Draw a line $l$ (horizontal line) find intersections between segments and $l$,
- Order segments from left to right according to the intersecting point on $l$
- Now, we know which segments are close to each (w.r.t l)

## Plane Sweep

- Now if we move the line up and down
- we should reveal the relationships (closeness) of the line segment across the plane
- How do you compute the intersections between $l$ and segments efficiently?
- Do you have to compute the intersections all the time when $l$ sweeps?

CS633

## Plane Sweep

- How do you compute the intersections between $l$ and segments efficiently?
- Project the interval to Y -axis and build a data structure (interval tree) (?)

## Plane Sweep

- Do you have to compute the intersections all the time when $l$ when move up and down?
- No!
- The segment orders only change at the events:
- End points
- intersections

CS633

## Plane Sweep: Summary

- Status of $l$ : the set of segments intersecting $l$
- Maintain a data structure T so the intersecting segments are sorted from left to right
- Event points: where updates are required

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{6}$ to T$)$
$-S_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{5}$ to T )
$-\mathrm{S}_{5} \mathrm{~S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{2}$ to T )
$-S_{2} S_{5} S_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{3}$ to T )
$-\mathrm{S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{1}$ and $\mathrm{S}_{8}$ to T )
$-\mathrm{S}_{1} \mathrm{~S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{6} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{6}$ to T )
$-\mathrm{S}_{1} \mathrm{~S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : $\left(\operatorname{swap} S_{1}\right.$ and $S_{2}$ in $\left.T\right)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : $\left(\operatorname{swap} \mathrm{S}_{3}\right.$ and $\mathrm{S}_{5}$ in T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l:\left(\operatorname{add} \mathrm{S}_{7}\right.$ to T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{7} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : $\left(\operatorname{swap} \mathrm{S}_{7} \mathrm{~S}_{8}\right.$ in T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{8} \mathrm{~S}_{7}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{1}, \mathrm{~S}_{8}$ from T )
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{7}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{7}$ from T)
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{3}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{2}, \mathrm{~S}_{5}, \mathrm{~S}_{3}$ from T)
- $\phi$

## Plane Sweep Algorithm Sketch 1

- Create an event queue $Q$ and add the end points of the segments from top to bottom to the event queue
- Create a horizontal sweep line $l$ and maintain a sorted list T
- Repeat until no events in Q
- e $\leftarrow \mathrm{Q}$. .pop()
- Place $l$ ate
- Find the segments intersecting the sweep line $l$ and store them in T
- For each pair of adjacent segments in T
- Check intersection
- Add intersection to Q

## Plane Sweep Algorithm

To include the idea of being close in the horizontal direction, only test segments that are adjacent in the horizontal direction --

- Only test each with ones to its left and right
- New "status": ordered sequence of segments

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{6}$ to T )
- $\phi$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{6}$ to T )
- $\mathrm{S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{5}$ to T$)$
$-\mathrm{S}_{5} \mathrm{~S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{2}$ to T )
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{3}$ to T )
$-\mathrm{S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{1}$ and $\mathrm{S}_{8}$ to T)
$-\mathrm{S}_{1} \mathrm{~S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{6} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{6}$ to T )
$-\mathrm{S}_{1} \mathrm{~S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : $\left(\operatorname{swap} \mathrm{S}_{1}\right.$ and $\mathrm{S}_{2}$ in T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : $\left(\operatorname{swap} \mathrm{S}_{3}\right.$ and $\mathrm{S}_{5}$ in T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : (add $\mathrm{S}_{7}$ to T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{7} \mathrm{~S}_{8}$

## Plane Sweep

- Status of $l$ : (swap $\mathrm{S}_{7} \mathrm{~S}_{8}$ in T$)$
- $\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{8} \mathrm{~S}_{7}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{1}, \mathrm{~S}_{8}$ from T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{7}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{7}$ from T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{3}$

## Plane Sweep

- Status of $l$ : (delete $\mathrm{S}_{2}, \mathrm{~S}_{5}, \mathrm{~S}_{3}$ from T )
$-\phi$

## Plane Sweep Algorithm Sketch 1

## What's the problem of this algorithm?

- Create an event queue $Q$ and add end points of the segments from top to bottom to the event queue
- Create a horizontal sweep line $l$ and maintain a sorted list T
- Repeat until no events in Q
$-\mathrm{e} \leftarrow \mathrm{Q} \cdot \operatorname{pop}()$
- Place lat e
- Find the segments intersecting the sweep line $l$ and store them in T
- For each pair of adjacent segments in T
- Check intersection
- Add intersection to Q

No need to check all pairs!

## Plane Sweep Algorithm Sketch 2

- Create an event queue Q and add end points of the segments from top to bottom to the event queue
- Create a horizontal sweep line $l$ and maintain a sorted list T
- Repeat until no events in Q
$-\mathrm{e} \leftarrow \mathrm{Q} . \operatorname{pop}()$
- Place $l$ at e
- If e is an upper point of a segment $s$
- Add $s$ to T
- Check intersection between $s$ and $s^{\prime}$ left and right segments in $T$
- If e is a lower point of a segment $s$
- Remove $s$ from T
- Check intersection between $s^{\prime}$ left and right segments in T
- If e is an intersecting point of a set of segments $S$
- Reorder S in T accordingly
- Check the leftmost segment with the segment on its left
- Check the rightmost segment with the segment on its right

CS633

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{6}$ to T )
- $\mathrm{S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{5}$ to T$)$
$-\mathrm{S}_{5} \mathrm{~S}_{6}$
Check intersection: $\mathrm{S}_{5} \mathrm{~S}_{6}$

## Plane Sweep

- Status of $l$ : (insert $\mathrm{S}_{2}$ to T )

$$
-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{6}
$$

Check intersection: $\mathrm{S}_{2} \mathrm{~S}_{5}$

## Plane Sweep

- T - Status of $l$ : (insert $\mathrm{S}_{3}$ to T )
$-\mathrm{S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{6}$
Check intersection: $\mathrm{S}_{3} \mathrm{~S}_{5}$
Check intersection: $\mathrm{S}_{3} \mathrm{~S}_{2}$

## Plane Sweep

- T - Status of $l$ : (insert $\mathrm{S}_{1}$ and $\mathrm{S}_{8}$ to T )
$-\mathrm{S}_{1} \mathrm{~S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{6} \mathrm{~S}_{8}$ Check intersection: $\mathrm{S}_{1} \mathrm{~S}_{2}$ Check intersection: $\mathrm{S}_{8} \mathrm{~S}_{6}$

## Plane Sweep

- T-Status of $l$ : (delete $\mathrm{S}_{6}$ to T)
$-\mathrm{S}_{1} \mathrm{~S}_{2} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{8}$
Check intersection: $\mathrm{S}_{5} \mathrm{~S}_{8}$

## Plane Sweep

- T-Status of $l$ : (swap $\mathrm{S}_{1}$ and $\mathrm{S}_{2}$ in T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{3} \mathrm{~S}_{5} \mathrm{~S}_{8}$
Check intersection: $\mathrm{S}_{1} \mathrm{~S}_{3}$

## Plane Sweep

- T-Status of $l$ : (swap $\mathrm{S}_{3}$ and $\mathrm{S}_{5}$ in T)
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{8}$
Check intersection: $\mathrm{S}_{1} \mathrm{~S}_{5}$
Check intersection: $\mathrm{S}_{3} \mathrm{~S}_{8}$

## Plane Sweep

- T - Status of $l$ : (add $\mathrm{S}_{7}$ to T)
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{7} \mathrm{~S}_{8}$
Check intersection: $\mathrm{S}_{7} \mathrm{~S}_{3}$
Check intersection: $\mathrm{S}_{7} \mathrm{~S}_{8}$

## Plane Sweep

- T - Status of $l$ : (swap $\mathrm{S}_{7} \mathrm{~S}_{8}$ in T$)$
$-\mathrm{S}_{2} \mathrm{~S}_{1} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{8} \mathrm{~S}_{7}$
Check intersection: $\mathrm{S}_{8} \mathrm{~S}_{3}$

## Plane Sweep

- T-Status of $l$ : (delete $\mathrm{S}_{1}, \mathrm{~S}_{8}$ from T)
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{3} \mathrm{~S}_{7}$
Check intersection: $\mathrm{S}_{2} \mathrm{~S}_{5}$

## Plane Sweep

- T - Status of $l$ : (delete $\mathrm{S}_{7}$ from T)
$-\mathrm{S}_{2} \mathrm{~S}_{5} \mathrm{~S}_{3}$

## Plane Sweep

- T - Status of $l:\left(\right.$ delete $S_{2}, S_{5}, S_{3}$ from $\left.T\right)$
$-\phi$

## Nasty Cases (Degeneracies)

- Horizontal lines
- Overlapping line segments
- Multiple line segments intersect at one single point

## Handling Changes in Status

## HandleEventPoint (p)

Let $U(p)$ be set of segments whose upper end point is $p$
Search in $T$ for set $S(p)$ of all segments that contains $p$;
they are adjacent in $T$. Let $L(p) \subset S(p)$ be the set of
segments whose lower endpts in $p$ and $C(p) \subset S(p)$ be
See your textbook for detail
Most of these are just some work on bookkeeping
Delete segments in $L(p) \cup C(p)$ from $T$
Insert segments in $U(p) \cup C(p)$ into $T$. Order segments
in $T$ according to their order on sweep line just below $p$

## Event Queue Structure

- Event queue requires the following methods
- remove next event and return it to be treated
- among 2 events with the same $y$-coordinate, the one with smaller $x$-coordinate is returned (left-to-right priority order)
- allows for insertions \& check if it is already there
- allows 2+ event points to coincide (ex) two upper end points coincide

## Status Structure, T

- Store the segments in a balanced binary search tree $T$ according to their orders
- both fetching \& insertion takes $O(\log m)$ time, where $m$ is the number of events
- Maintain the status of / using $T$
- the left-to-right order of segments on the line $/ \leftrightarrow$ the left-to-right order of leaves in $T$
- segments in internal nodes guide search
- each update and search takes $O(\log n)$

## Status Structure, T

## Handling Changes in Status

## Algorithm Analysis

- Important property
- All the intersections above the sweep line must be found
- Poof: When the sweep line is "Very close" to the intersection, its intersecting line segments must become adjacent!

## Algorithm Analysis

- Correctness: Does the algorithm find all intersections? (sketch)
- Assume there is an intersecting point $p$ that is not found
$\Rightarrow$ The segments intersecting at $p$ never become adjacent when the line sweeps down
$\Rightarrow$ There is no event above $p$, which makes the segments adjacent
$\Rightarrow$ However, this is not possible.

## Algorithm Analysis

- Let $S$ be a set of $n$ segments in a plane
- All intersections in $S$ can be reported in
$-O(n \log n+k \log n)$ time
- where $k$ is the size of the output (output includes intersection points and line segments intersecting at the points)
$-O(n+I)$ space
- where $I$ is the size of the number of intersections

## Algorithm Analysis

- With better analysis using Euler's Formula
$-O(n \log n+I \log n)$ time
- where $I$ is the size of the number of intersections
- Let $p$ be all intersections, then $k=\sum m(p)$.
- By treating the segments and intersections as a planar graph, we know $m(p)=\operatorname{degree}(p)$
- Therefore, $k=\sum_{p} m(p)=\sum_{p} \operatorname{degree}(p)=2|E|$.
- So, how large is $|\mathrm{E}|$, the number of edges in G ?

## Algorithm Analysis

- O(n) space, without storing all events
- e.g. only store intersection points of pairs of segments that are currently adjacent on the sweep line

## Application 1 <br> Thematic Map Overlay

- Now, we are be to do this:

## Application 2 Overlay of Subdivisions

- Let $S_{1}, S_{2}$ be two planar subdivisions of complexity $n_{1}$ and $n_{2}$ respectively; and let $n=$ $n_{1}+n_{2}$
- Overlay of $S_{1}$ and $S_{2}$ can be constructed in $O(n \log n+k \log n)$ time, where $k$ is the complexity of overlay

## Define a Subdivision: Doubly-Connected Edge List

- 3 records: vertices, faces and "half-edges"
- Vertex:
- coordinates(v)
- a ptr to a half-edge
- Face:
- OuterComponent(f): outer boundary
- InnerComponent(f): holes boundaries
- Half edge:
- a ptr to Origin(e)
- a ptr to a twin-edge
- ptrs to Next(e) \& Prev(e) edges
- its left IncidentFace(e)

## Doubly-Connected Edge List

- $\mathrm{V}_{3}$ :
- coordinates(v)
- a ptr to a half-edge $\mathrm{e}_{3}$
- $f_{2}$ :
- OuterComponent(f): $\mathrm{e}_{6}$
- InnerComponent(f): $\mathrm{e}_{11}$
- $\mathrm{e}_{1}$ :
- a ptr to Origin(e): $\mathrm{V}_{3}$
- a ptr to a twin-edge: $\mathrm{e}_{2}$
$-\quad$ ptrs to $\operatorname{Next}(\mathrm{e}) \& \operatorname{Prev}(\mathrm{e})$ edges: $\mathrm{e}_{2}$ and $\mathrm{e}_{9}$
- its left IncidentFace(e): $f_{1}$

## Doubly-Connected Edge List

- How do you find all incident edges of $\mathrm{f}_{1}$ ?
- How do you find all incident vertices of $\mathrm{e}_{4}$ ?
- How do you find all incident edges of $\mathrm{v}_{3}$ ?
- How do you find all incident faces of $\mathrm{v}_{3}$ ?

## Application 2 四要 Overlay of Subdivisions

1. Find intersections
2. Update half-edges

3. Update faces
4. Find boundaries
5. Classify boundaries (external or hole)
6. Group boundaries

## Application 2 Overlay of Subdivisions

## Update faces

1. Find boundaries (cycles)
2. Classify boundaries (external or hole)
3. Group boundaries

## Application 3 Polygon intersection

- Let $P_{1}, P_{2}$ be two polygons, check if they collide with each other in $\mathrm{O}(n \log n)$ time

collision
no collision

## Application 4 Boolean Operations

- Let $P_{1}, P_{2}$ be two polygons with $n_{1}$ and $n_{2}$ vertices respectively; and let $n=n_{1}+n_{2}$
- Their Boolean operations (intersection, union, and difference) can each be computed in $O(n$ $\log n+k \log n$ ) time, where $k$ is the complexity of the output

## Application 4 Boolean Operations

- P-Q
- $P \cup Q$
- $P \cap Q$

## Application 5 3D Morphing

YGEORGE
ANIVERSIT

- Compute or specify corresponding regions

- Merge corresponding regions

Feature-based Surface Decomposition for
Polyhedral Morphing; Gregory, Arthur; State,
Andrei; Lin, Ming C.; Manocha, Dinesh; Livingston,
Mark A.. Proceedings of the Symposium on
Computational Geometry. 1999. pp 415-416.

## Application 3D Morphing

- Now we have found the correspondences for all points!

- Specify how each point move to its corresponding point

Another example using this technique

## Conclusion

- Line segments intersection
- Line sweep paradigm
- Output sensitive algorithm
- Doubly-linked edge list
- Representing subdivisions
- Applications
- GIS map overlay (lines, regions)
- 2D collision detection and Boolean operations
- 3D morphing

## Homework Assignment

- Exercise: 2.1, 2.11, 2.14

Next time: Art Gallery problem \& Triangulation
