LOGIC COVERAGE

Semantic Logic Criteria

Logic expressions show up in many situations

Logic expressions can come from many sources

- Decisions in programs
- FSMs and state charts

Requirements

Covering logic expressions is *required* by the US Federal Aviation Administration (FAA) for safety-critical software (regulation DO-178B/C)

MCDC – Modified Condition/Decision Coverage

Tests are intended to choose some subset of the total number of *truth assignments* (e.g. true/false) to the expressions

Logic predicates and Clauses

Predicate: an expression that evaluates to a boolean value Predicates can contain

Boolean variables or function calls

Non-Boolean variables that contain relational operators (<, >, ==, <=, >=, !=) Logical operators

negation operator (Java: !)

∧ *and* operator (Java: &&)

 \bigvee or operator (Java: ||)

 \bigoplus *exclusive or* operator (Java: ^)

implication operator

↔ *equivalence* operator

Clause: a predicate without logical operators

Semantic Logic Criteria

 $(a < b) \lor f(z) \land d \lor (m \ge n^* o)$

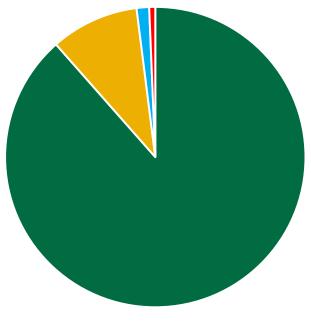

This predicate has four clauses:

- (a < b) : a relational expression
- f(z) : a boolean function
- **d** : a boolean variable
- (*m* >= *n***o*): a relational expression

Predicate and Clause statistics

From a study of 63 open-source programs which contained > 400,000 predicates:

88.5% had only 1 clause9.5% had 2 clauses1.35% had 3 clausesOnly 0.65% had 4 ormore clauses

■ 1 ■ 2 ■ 3 ■ 4+

Predicate and Clause statistics

Predicates can be derived from: Decisions in program source code Guards on finite state machine transitions Decisions in UML activity graphs Requirements, both formal and informal SQL queries ...and more

Logic Coverage Criteria

We use predicates in testing to:

Develop a model of the software as one or more predicates Require tests to satisfy some combination of clauses

Abbreviations:

P is a set of predicates *p* is a predicate in *P C* is the set of clauses in *P Cp* is the set of clauses in predicate *p c* is a clause in *C*

Predicate Coverage

The first (and simplest) criterion requires that each predicate be evaluated to both true and false

Predicate Coverage (PC) – For each p in P, TRcontains two requirements: p evaluates to true,and p evaluates to false

When predicates come from conditions on graph edges, this is equivalent to *edge coverage*

Predicate Coverage Example

 $(a < b) \lor d \land (m \ge n^*o)$

Predicate must evaluate to true

Predicate must evaluate to false

Predicate Coverage Example

 $(a < b) \lor d \land (m \ge n^*o)$

Predicate must evaluate to true

Example test case: a=5, b=10, d=true, m=1, n=1, o=1 $= ((5 < 10) \lor true) \land (1 \ge 1*1)$ $= (true \lor true) \land (true)$ = true

Predicate Coverage Example

 $(a < b) \lor d \land (m \ge n^*o)$

Predicate must evaluate to true

Example test case: a=5, b=10, d=true, m=1, n=1, o=1 $= ((5 < 10) \lor$ true) $\land (1 \ge 1*1)$ = (true \lor true) $\land ($ true) =true

Predicate must evaluate to false

Example test case: a=10, b=5, d=false, m=1, n=1, o=1 $= ((10 < 5) \lor false) \land (1 \ge 1*1)$ $= (false \lor false) \land (true)$ = false

Clause Coverage

Predicate coverage does not require evaluation of all clauses, so a more complete criterion is clause coverage

Does clause coverage subsume predicate coverage?

Clause Coverage

Predicate coverage does not require evaluation of all clauses, so a more complete criterion is clause coverage

Does clause coverage subsume predicate coverage?

No! Consider $a \lor b$, the clauses can be satisfied with (*a*=true, *b*=false) and (*a*=false, *b*=true) but the predicate is always true

Clause Coverage Example $(a < b) \lor d \land (m \ge n^* o)$

Clauses must evaluate to true

In this case we arbitrarily choose to set all clauses to true at the same time, but that is not required

Clause Coverage Example $(a < b) \lor d \land (m \ge n^*o)$

Clauses must evaluate to true

In this case we arbitrarily choose to set all clauses to true at the same time, but that is not required

d : true

(*m* >= *n***o*) : *m*=1, *n*=1, *o*=1

Clause Coverage Example

 $(a < b) \lor d \land (m \ge n^*o)$

Clauses must evaluate to true

In this case we arbitrarily choose to set all clauses to true at the same time, but that is not required

Clauses must evaluate to false

Limitations of PC and CC

PC does not fully exercise all the clauses, especially with short-circuit evaluation

 $(a < b) \lor (c < d)$: if (a < b) is true, then (c < d) is not evaluated CC does not always ensure PC (and so CC *does not subsume* PC)

We can satisfy CC without causing the entire predicate to be both true and false

That doesn't seem like something we want to do...

The simplest solution is to just test *all combinations*

Combinatorial Coverage

Combinatorial Coverage (CoC) – For each p in P, TR contains a test requirement for the clauses in C_p to evaluate to each possible combination of truth values

Combinatorial coverage is conceptually simple and complete, but very expensive Results in 2^N tasts, where N is the number of clauses

Results in 2^{N} tests, where N is the number of clauses

Combinatorial Coverage Example

	a <b< th=""><th>d</th><th>m>=n*o</th><th>$((a < b) \lor d) \land (m \ge n^* o)$</th></b<>	d	m>=n*o	$((a < b) \lor d) \land (m \ge n^* o)$
1	Т	Т	Т	Т
2	Т	Т	F	F
3	Т	F	Т	Т
4	Т	F	F	F
5	F	Т	Т	Т
6	F	Т	F	F
7	F	F	Т	F
8	F	F	F	F

Is there a better way?

Testing literature has lots of suggestions, some of them confusing or conflicting

The general idea is simple: *test each clause independently from the other clauses*

But what does "independently" mean?

Active Clauses

Clause coverage has a weakness: the values don't always make a difference

- Consider the first test case for clause coverage where each clause was true
- ((5 < 10) ∨ true) ∧ (1 >= 1*1)

If we change *only one clause*, then only changing the last clause can change the evaluation of the predicate!

Given these values, the third clause *determines* the predicate

Active Clauses

To really test the results of a clause, the clause should be the determining factor to the value of the predicate

Determination: a selected clause c_i in predicate p, called the *major clause*, determines p if and only if the values of the remaining *minor clauses* c_j are such that changing the value of c_i changes the value of p

Such a condition makes clause *c_i active*

Active Clauses

Consider $p = a \lor b$

If **a**=false, then **b** determines **p** If **b**=false, then **a** determines **p** Consider $p = a \land b$

If *a*=true, then *b* determines *p* If *b*=true, then *a* determines *p*

The goal is to find test cases for each selected major clause when the clause determines the value of the predicate

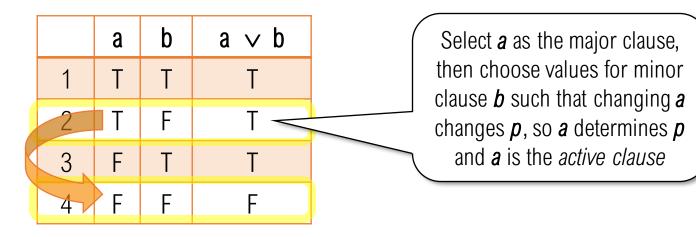

This is formalized in a *family of criteria* that have subtle but important differences

Active Clause Coverage Example $p = a \lor b$

 $a \lor b$ b а Τ 1 2 Т F Τ 3 F Τ Τ F F F 4

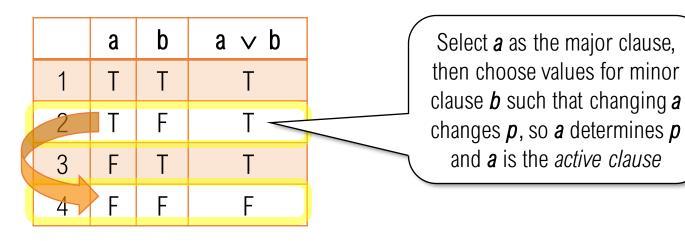

Active Clause Coverage Example

 $p = a \lor b$

Active Clause Coverage Example

 $p = a \lor b$

Select **b** as the major clause, then choose values for minor clause **a** such that changing **b** changes **p**, so **b** determines **p** and **b** is the *active clause*

Calculating Determination

Finding values for minor clauses is easy for simple predicates, but hard for complex ones

Definitional approach:

 $p_{c=true}$ is predicate p with every occurrence of clause c replaced by true

 $p_{c=\mathrm{false}}$ is predicate p with every occurrence of clause c replaced by false

To find values for minor clauses, *exclusive or* $p_{c=true}$ and $p_{c=false}$

 $p_c = p_{c=true} \oplus p_{c=false}$ After solving, p_c describes exactly the values needed for c to determine p

$$p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$$

$$p_a = p_{a=true} \oplus p_{a=false}$$

 $p_a = (true \lor b) \oplus (false \lor b)$

$$p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$$

$$p_a = (\text{true} \lor b) \oplus (\text{false} \lor b)$$

$$p_a = \text{true} \oplus b$$

$$p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$$

$$p_a = (\text{true} \lor b) \oplus (\text{false} \lor b)$$

$$p_a = \text{true} \oplus b$$

$$p_a = \neg b$$

Consider $p = a \lor b$

$$p_a = \rho_{a=\text{true}} \oplus \rho_{a=\text{false}}$$

$$\rho_a = (\text{true} \lor b) \oplus (\text{false} \lor b)$$

$$\rho_a = \text{true} \oplus b$$

$$\rho_a = \neg b$$

Thus *a* determines *p* when *b*=false

Consider $p = a \land b$

Consider $p = a \land b$

$$p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$$

Consider $p = a \land b$

$$p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$$
$$p_a = (\text{true} \land b) \oplus (\text{false} \land b)$$

Consider $p = a \land b$

$$p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$$

$$p_a = (\text{true} \land b) \oplus (\text{false} \land b)$$

$$p_a = b \oplus \text{false}$$

Consider $p = a \land b$ $p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$ $p_a = (\text{true} \land b) \oplus (\text{false} \land b)$ $p_a = b \oplus \text{false}$

$$p_a = b \odot$$

 $p_a = b$

Consider $p = a \land b$

 $p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$ $p_a = (\text{true} \land b) \oplus (\text{false} \land b)$ $p_a = b \oplus \text{false}$ $p_a = b$

Thus *a* determines *p* when *b* = true

Consider $p = a \lor (b \land c)$

Consider $p = a \lor (b \land c)$

 $p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$

Consider $p = a \lor (b \land c)$ $p_a = p_{a=\text{true}} \oplus p_{a=\text{false}}$ $p_a = (\text{true} \lor (b \land c)) \oplus (\text{false} \lor (b \land c))$

Consider $p = a \lor (b \land c)$ $p_a = p_{a=true} \oplus p_{a=false}$ $p_a = (true \lor (b \land c)) \oplus (false \lor (b \land c))$ $p_a = true \oplus b \land c$

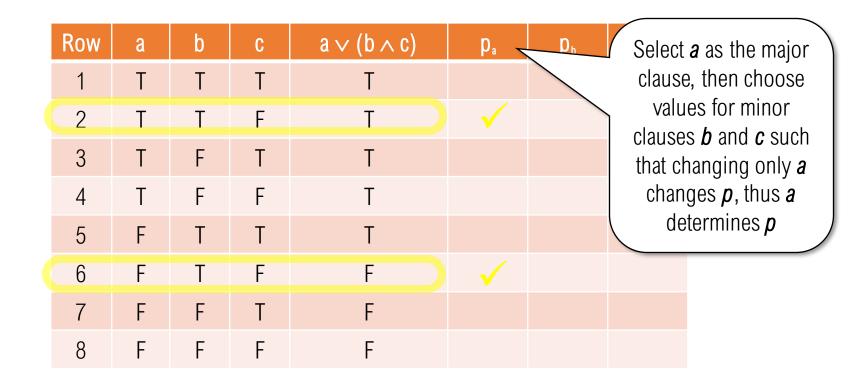

Consider $p = a \lor (b \land c)$ $p_a = p_{a=true} \oplus p_{a=false}$ $p_a = (true \lor (b \land c)) \oplus (false \lor (b \land c))$ $p_a = true \oplus b \land c$ $p_a = \neg (b \land c)$

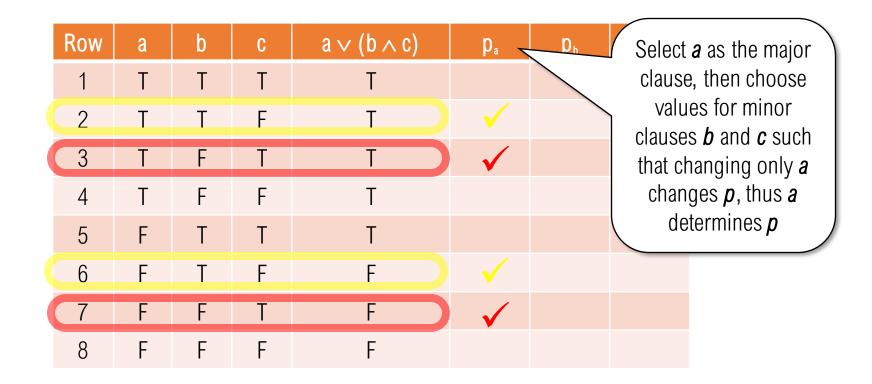

Consider $p = a \lor (b \land c)$ $p_a = p_{a=true} \oplus p_{a=false}$ $p_a = (true \lor (b \land c)) \oplus (false \lor (b \land c))$ $p_a = true \oplus b \land c$ $p_a = \neg (b \land c)$ $p_a = \neg b \lor \neg c$

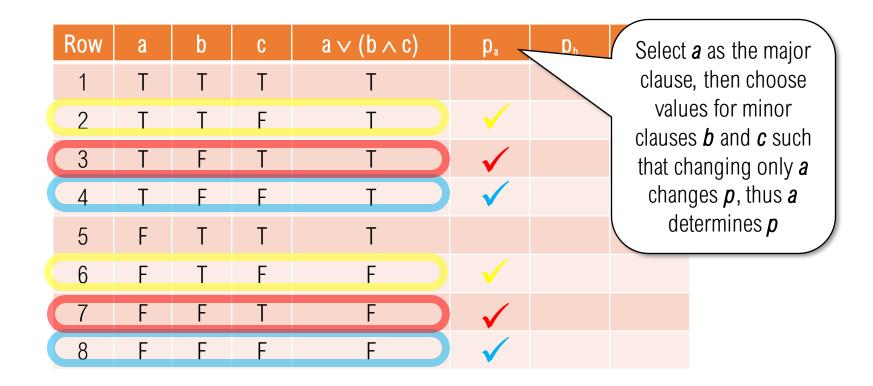

Consider $p = a \lor (b \land c)$ $p_a = p_{a=true} \oplus p_{a=false}$ $p_a = (true \lor (b \land c)) \oplus (false \lor (b \land c))$ $p_a = true \oplus b \land c$ $p_a = \neg (b \land c)$ $p_a = \neg b \lor \neg c$

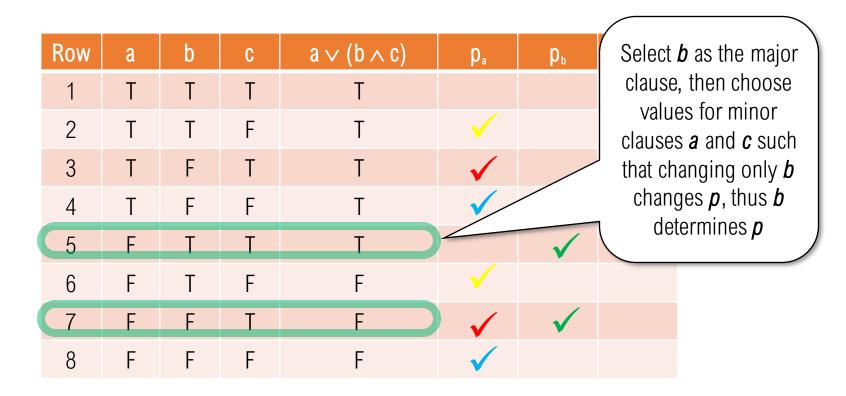

Thus *a* determines *p* when *b*=false or *c*=false

Active Clause Coverage

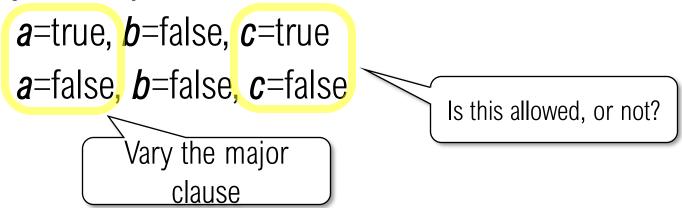

Active Clause Coverage (ACC) – For each p in Pand each major clause c_i in C_p , choose minor clauses c_j (j!=i) such that c_i determines p. TRhas two requirements for c_i : c_i evaluates to true and c_i evaluates to false

DEFINITION

MCDC Ambiguity

Do the minor clauses have to *retain the same values* while the major clause changes between true and false?

Example: given $p = a \lor (b \land c)$, if a is the major clause then when we vary the major clause:

This question has caused confusion among safety-critical testers for years

Resolving the Ambiguity

- Three possible answers (which leads to three different coverage criteria)
 - Minor clauses *do not* need to be the same
 - Minor clauses can *force the predicate* to become both true and false
 - Minor clauses do need to be the same

General Active Clause Coverage

Minor clauses do not need to be the same

DEFINITION

General Active Clause Coverage (GACC) – For each p in P and each major clause c_i in C_p , choose minor clauses c_j (j!=i) such that c_i determines p. TR has two requirements for c_i : c_i evaluates to true and c_i evaluates to false. The values chosen for minor clauses c_j do not need to be the same when c_i is true as when c_i is false, and the value of p does not need to change.

It is possible to satisfy GACC without satisfying predicate coverage

Correlated Active Clause Coverage

Minor clauses can force the predicate

Correlated Active Clause Coverage (CACC) – For each p in P and each major clause c_i in C_p , choose minor clauses c_j (j!=i) such that c_i determines p. TR has two requirements for c_i : c_i evaluates to true and c_i evaluates to false. The values chosen for minor clauses c_j must cause p to be true for one value of major clause c_i and false for the other value of c_i .

Subsumes predicate coverage This is "masking MCDC"*

DEFINITION

Restrictive Active Clause Coverage

Minor clauses *do* need to be the same

DEFINITION

Restricted Active Clause Coverage (RACC) – For each *p* in *P* and each major clause c_i in C_p , choose minor clauses c_i (j!=i) such that c_i determines p. TR has two requirements for c_i : c_i evaluates to true and c_i evaluates to false. The values chosen for minor clauses c_i must must be the same when c_i is true as when **c**_i is false.

This is "unique-cause MCDC", the common interpretation of MCDC* Often leads to *infeasible test requirements*

* DOT/FAA/AR-01/18 "An Investigation of Three Forms of the Modified Condition Decision Coverage (MCDC) Criterion", April 2001

Active Clause Comparison

To satisfy an active clause coverage criterion, pick a pair of tests where...

Criterion	Major clause determines p	Major clause changes value	Changing major clause changes p	Minor clauses are held the same
GACC	\checkmark	\checkmark		
CACC	\checkmark	\checkmark	\checkmark	
RACC	\checkmark	\checkmark	\checkmark	\checkmark

GACC VS. CACC VS. RACC Example

Evaluation process

- 1. Select a major clause
- 2. Determine the conditions for the minor clauses where the major clause determines the predicate
- 3. For GACC, select a pair of conditions where the value of the major clause changes (the value of the minor clauses and *p* may or may not change)
- 4. For CACC, select a pair of conditions where the value of the major clause changes and the value of *p* changes (the minor clauses may or may not change)
- 5. For RACC, select a pair of conditions where the value of the major clause changes, the values of the minor clauses are held constant, and the value of p changes

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

1. Select a major clause -- a

	a	b	C	p=(a∧b)√(¬a∧¬b∧c)			
1	Т	Т	Т	Т			
2	Т	Т	F	Т			
3	Т	F	Т	F			
4	Т	F	F	F			
5	F	Т	Т	F			
6	F	Т	F	F			
7	F	F	Т	Т			
8	F	F	F	F			
5 6 7	F F F	T T F	T F T	F F T			

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

2. Determine the conditions for the minor clauses where the major clause determines the predicate

Using the XOR approach:

$$p_{a} = p_{a=\text{true}} \oplus p_{a=\text{false}}$$

$$p_{a} = (T \land b) \lor (\neg T \land \neg b \land c) \oplus (F \land b) \lor (\neg F \land \neg b \land c)$$

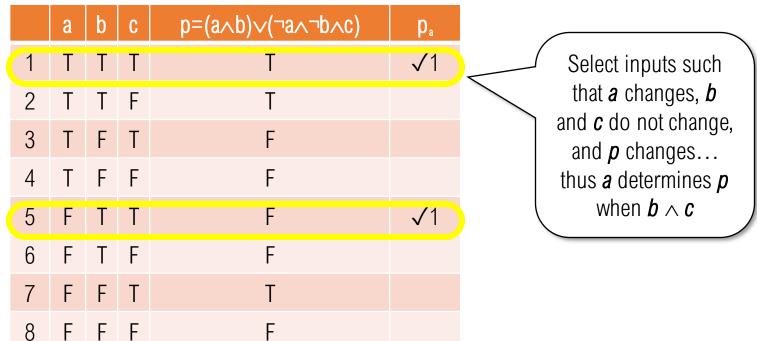

$$p_{a} = b \lor (F \land \neg b \land c) \oplus F \lor (T \land \neg b \land c)$$

$$p_{a} = b \oplus \neg b \land c$$

$$p_{a} = b \lor c$$

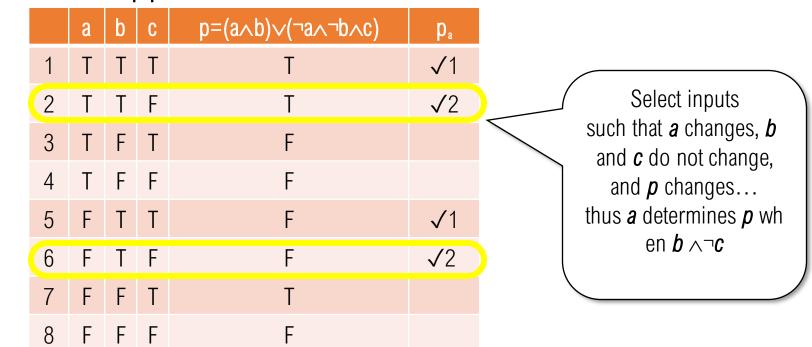

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

2. Determine the conditions for the minor clauses where the major clause determines the predicate

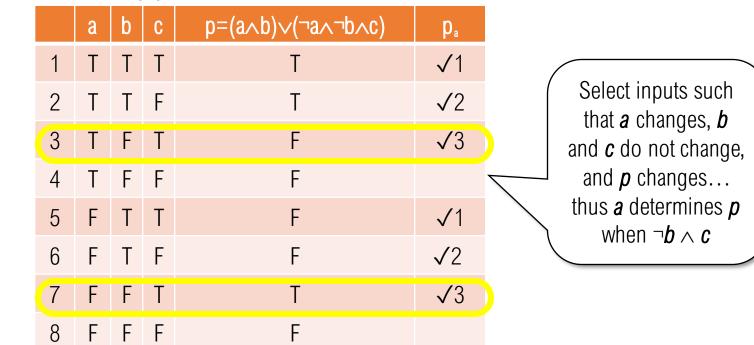

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

2. Determine the conditions for the minor clauses where the major clause determines the predicate

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

2. Determine the conditions for the minor clauses where the major clause determines the predicate

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

2. Determine the conditions for the minor clauses where the major clause determines the predicate

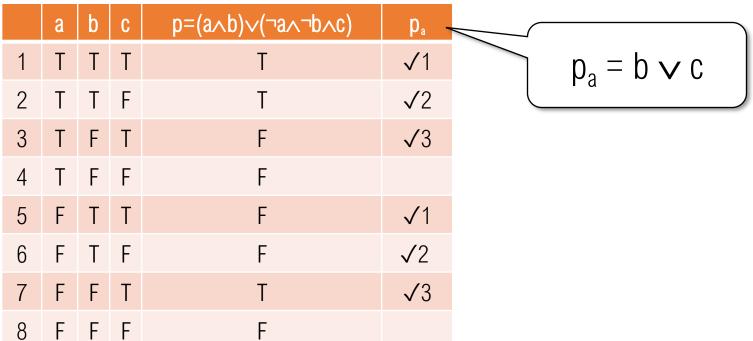

Using the truth table approach:

			•			
	a	b	C	p=(a∧b)√(¬a∧¬b∧c)	р _а	
1	Т	Т	Т	Т	√ 1	
2	Т	Т	F	Т	√2	
3	Т	F	Т	F	√3	
4	Т	F	F	F		
5	F	Т	Т	F	√ 1	
6	F	Т	F	F	√2	
7	F	F	Τ	Т	√3	
8	F	F	F	F		

Select inputs such that a changes, band c do not change... but pDOES NOT change, thus a DOES NOT determines p when $\neg b \land \neg c$

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

2. Determine the conditions for the minor clauses where the major clause determines the predicate

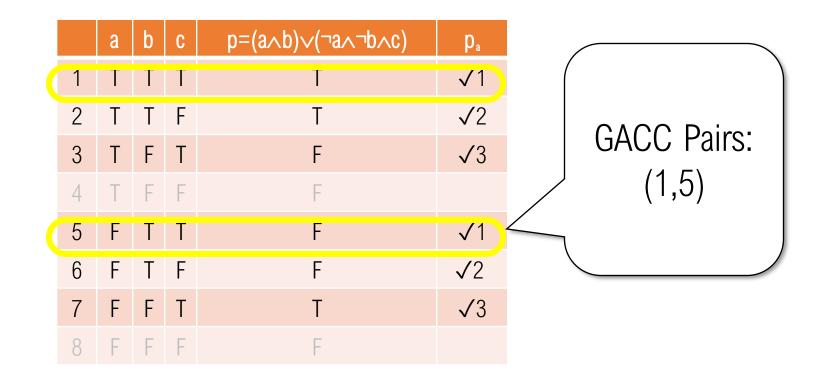

To satisfy an active clause coverage criterion, pick a pair of tests where...

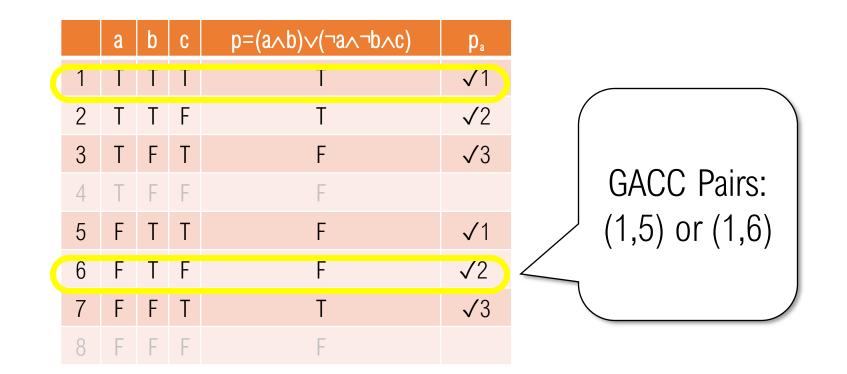

Criterion	Major clause determines p	Major clause changes value	Changing major clause changes p	Minor clauses are held the same
GACC	\checkmark	\checkmark		
CACC	\checkmark	\checkmark	\checkmark	
RACC	\checkmark	\checkmark	\checkmark	\checkmark

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

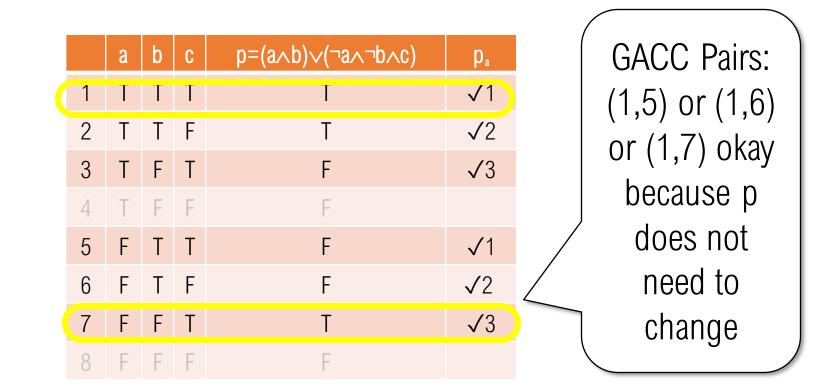

3. For GACC, select a pair of conditions where the value of the major clause changes (the value of the minor clauses and *p* may or may not change)

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

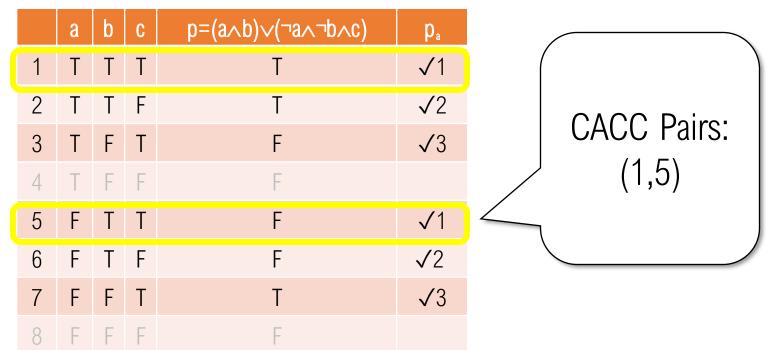

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

	а	b	C	p=(a∧b)√(¬a∧¬b∧c)	Pa
1	Т	Т	Τ	Т	√1
2	Т	Т	F	Т	√2
3	Т	F	Т	F	√3
4	Τ	F	F	F	
5	F	Т	Τ	F	√1
6	F	Т	F	F	√2
7	F	F	Т	Т	√3
8	F	F	F	F	

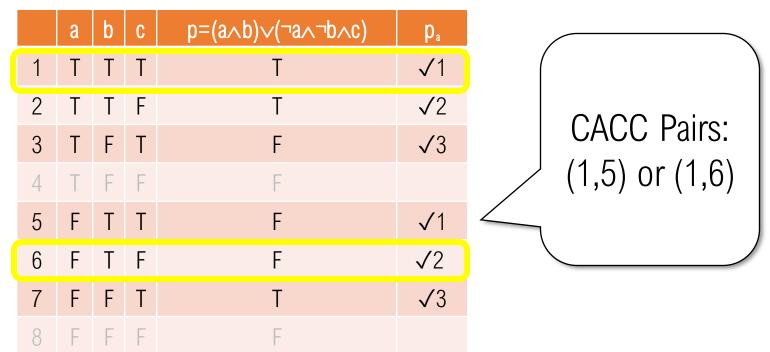

To satisfy an active clause coverage criterion, pick a pair of tests where...

Criterion	Major clause determines p	Major clause changes value	Changing major clause changes p	Minor clauses are held the same
GACC	\checkmark	\checkmark		
CACC	\checkmark	\checkmark	\checkmark	
RACC	\checkmark	\checkmark	\checkmark	\checkmark

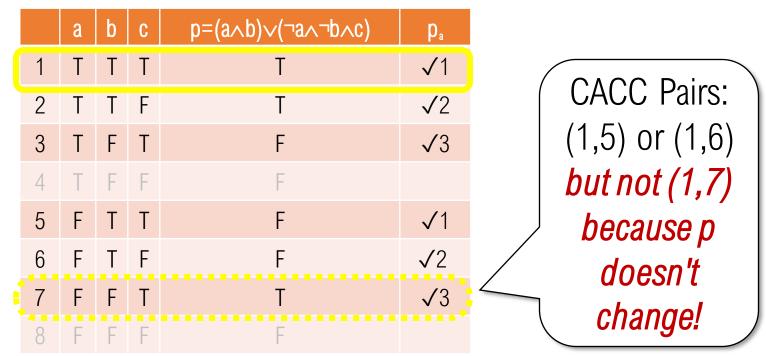

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

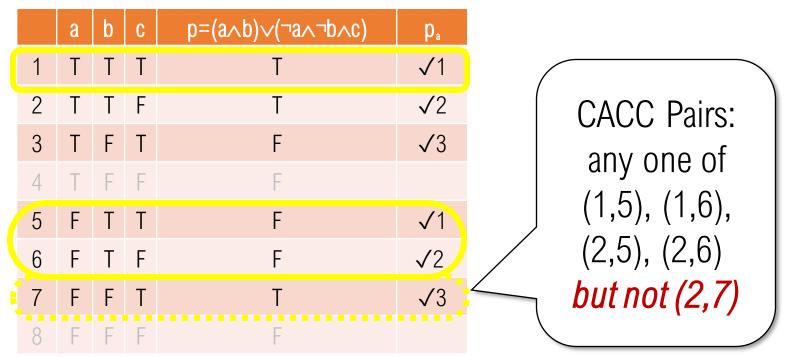

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

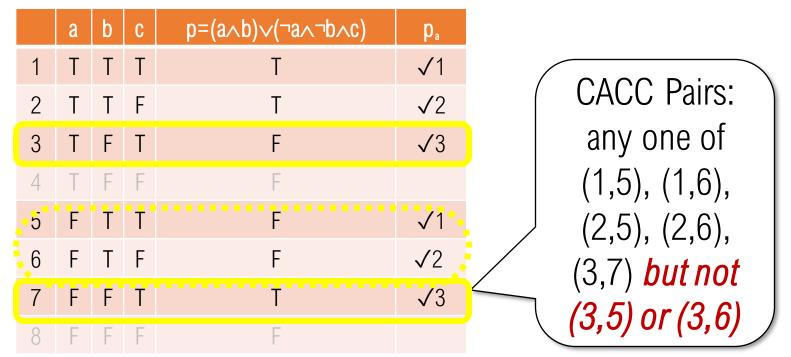

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

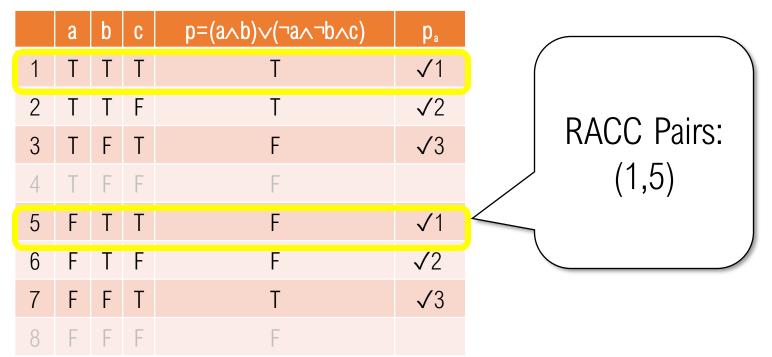

To satisfy an active clause coverage criterion, pick a pair of tests where...

CACC	\checkmark	\checkmark	\checkmark	
RACC	\checkmark	\checkmark	\checkmark	\checkmark

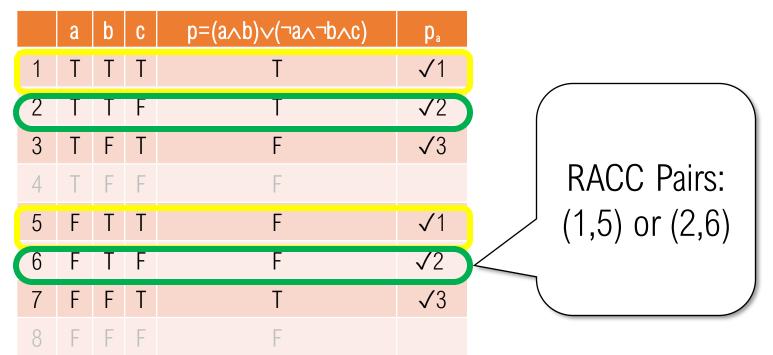

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

5. For RACC, select a pair of conditions where the value of the major clause changes, the values of the minor clauses are held constant, and the value of p changes

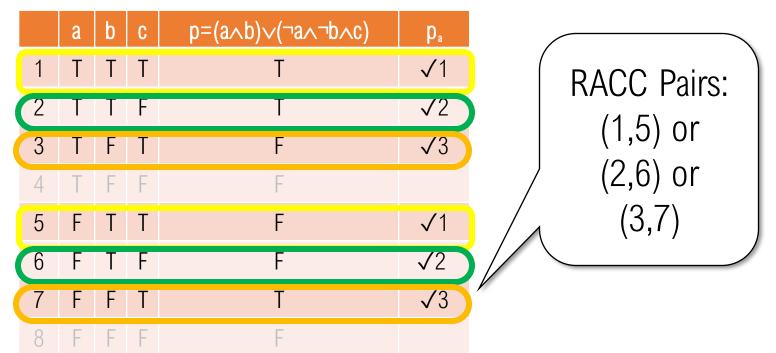

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

5. For RACC, select a pair of conditions where the value of the major clause changes, the values of the minor clauses are held constant, and the value of p changes

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

5. For RACC, select a pair of conditions where the value of the major clause changes, the values of the minor clauses are held constant, and the value of p changes

Inactive Clause Coverage

DEFINITION

Taking the opposite approach – major clauses *do not affect* the predicates

Inactive Clause Coverage (ICC) – For each p in P and each major clause c_i in C_p , choose minor clauses c_j (j!=i) such that c_i does not determine p. TR has four requirements for c_i : (1) c_i evaluates to true with p true, (2) c_i evaluates to false with p true, (3) c_i evaluates to true with p false, and (4) c_i evaluates to false with p false.

Why bother? It's useful for testing safety interlock systems to ensure that during certain circumstances a control variable does not have any effect on operation

General Inactive Clause Coverage

General Inactive Clause Coverage (GICC) – For each p in Pand each major clause c_i in C_p , choose minor clauses c_j (j!=i) such that c_i does not determine p. The values chosen for minor clauses c_j do not need to be the same when c_i is true as when c_i is false.

Restricted Inactive Clause Coverage (RICC) – For each p in P and each major clause c_i in C_p , choose minor clauses c_j (j!=i) such that c_i does not determine p. The values chosen for minor clauses c_j must be the same when c_i is true as when c_i is false.

DEFINITION

Inactive Clause Comparison

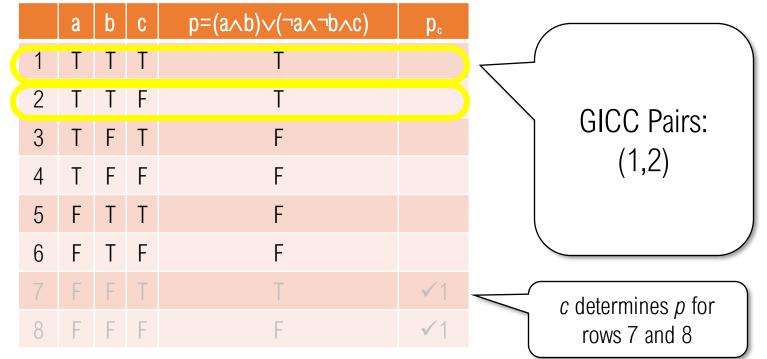

To satisfy an inactive clause coverage criterion, pick a pair of tests where...

Criterion	Major clause determines p	Major clause changes	Changing major clause changes p	Minor clauses are held the same		
GICC)				
RICC))		
By definition, if the major clause does not determine <i>p</i> , then changing the major clause will not change <i>p</i>						

GICC Example

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$ Selecting clause c as the major clause

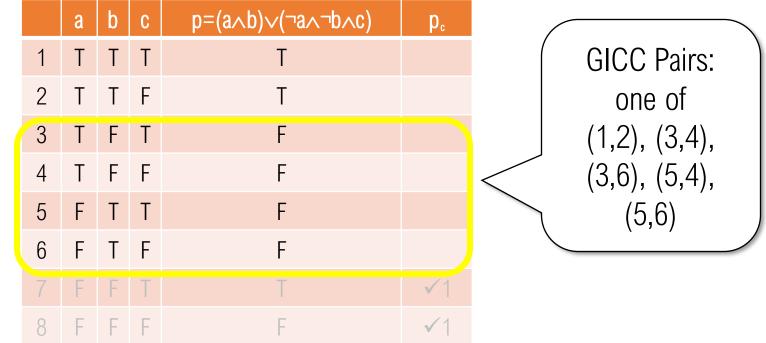

For GICC, select a pair of conditions where the major clause does not determine *p*, the value of the major clause changes, and the value of p does not change

GICC Example

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

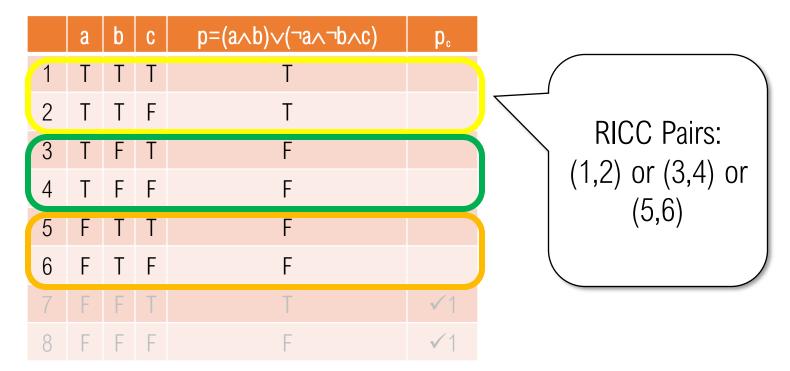

For GICC, select a pair of conditions where the major clause does not determine *p*, the value of the major clause changes, and the value of p does not change

RICC Example

Consider $p = (a \land b) \lor (\neg a \land \neg b \land c)$

For RICC, select a pair of conditions where the major clause does not determine p, the value of the major clause changes, and the value of p does not change, and the minor clauses are the same

Infeasibility

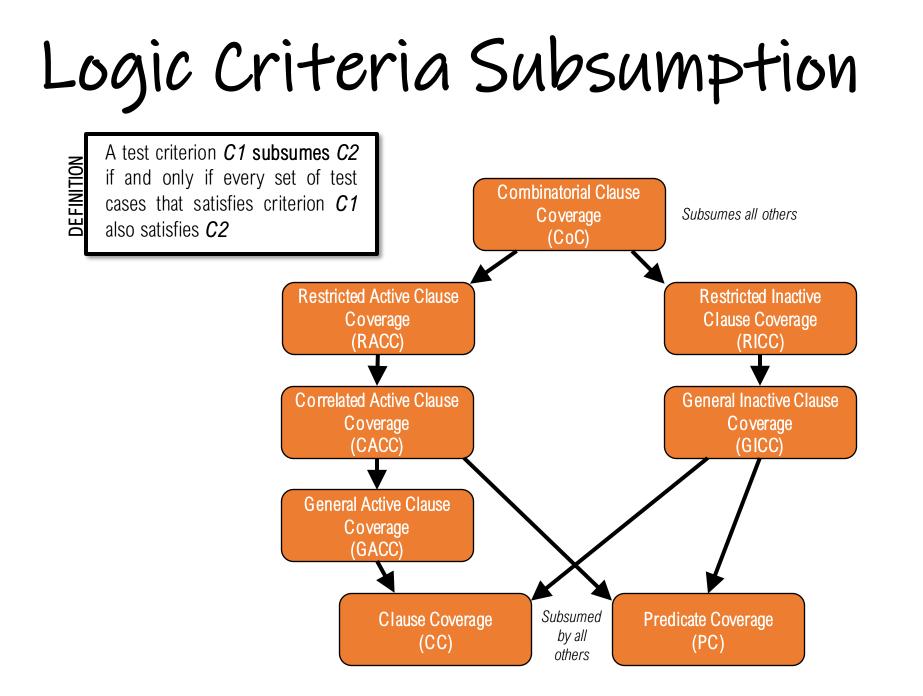

Infeasible test requirements are common

Given
$$p = (a > b \land b > c) \lor (c > a)$$

(*c* > *a*)=true is infeasible

As with ISP and graph criteria, infeasible test requirements must be *recognized and ignored*

Recognizing infeasible test requirements is difficult, and in general *undecidable*

Logic Coverage Summary

Predicates are often very simple – in practice, most have fewer than 3 clauses

That's good news, because fewer clauses *significantly* simplifies testing With only one clause, predicate coverage is sufficient With 2 or 3 clauses, combinatorial coverage may be practical With more complex clauses, ACC and ICC criteria are practical Testing safety-critical software often requires MCDC (or RACC or CACC)
