LOGISTICS

- HW2 due next week
- Questions?
DESIGN NOTATIONS

- What types of diagrams do you create when designing a new feature?
DESIGN NOTATIONS

- Previously looked at domain modeling
  - Goal: understand the structure of **problem** domain
- This time: design modeling
  - Goal: understand the structure of **solutions**
NOTATIONS SUPPORTING DESIGN VS NOTATIONS FOR COMMUNICATION

- Design notations sometimes used a specification mechanism (e.g., model driven software engineering)
  - Goal is completeness.
  - Want notation to rigorously model system.
  - Might use model to generate code
- Also used as notation for exploring design space (this class)
  - Goal is examine alternative designs, interrogate design against specific scenarios, iterate design
HISTORY OF DESIGN NOTATIONS

▸ As focus changed between different design problems, notations changed with focus

▸ 1970s: function level design: flow charts, data flow diagrams

▸ 1990s: OO design: UML class diagrams, sequence diagrams

▸ 2000s: architecture: component and connectors
DESIGN NOTATIONS

- Offer views that show some aspects of your system and hide other

- Some important notation choices
  - Show one configuration of the system or all possible configurations
  - Show steps in a sequence of a process or snapshot
  - Show element as a black box or white box with internal visible
CHOOSING A DESIGN NOTATION

- Use notation that helps understand some aspect of design
  - What types of elements exist and how are they related to each other: class diagram
  - How data is passed between different elements in the system: data flow diagram
  - How objects interact to implement a scenario: sequence diagram
  - How a system transitions state as a result of interactions with environment: state chart
NOTATIONS FOR DESIGN

- Class diagrams
- Data flow diagram
- Sequence diagram
- Statecharts
- Component and connectors
CLASS DIAGRAMS
CLASS DIAGRAMS

- Class: a class is in the system
- Inheritance (lines between): class A inherits from class B
- Containment: class A has a collection of instances of class B
DATA FLOW DIAGRAMS
DATA FLOW DIAGRAMS

- Store or processing element (nodes): some system element that performs some computation
- Flow (edge): data that is sent from one element to another element
Figure 11.2 Sequence Diagram for Validate PIN use case – Valid Pin
SEQUENCE DIAGRAMS

- Each object has a lifeline (vertical dashed line)
- Time flows from top to bottom
- Objects send messages to each other
- Can describe alternative sequences with labels on messages and boxes to group related behavior
IN CLASS ACTIVITY: COMMAND PATTERN

- In groups of 2 or 3,
  - Build a UML class diagram and sequence diagram describing command pattern

- The Command Pattern encapsulates a request as an object
  - Enables making a request on an object without knowing anything about the operation being requested or the receiver of the request.
  - Enables queue or logging requests, and supports undoable operations

- Build a UML class diagram describing example of a Command pattern, use sequence diagram to describe how requests are queued
STATECHART

Event: 1.2: Card Inserted / 1.3: Get PIN
Action: 2A.1: Cancel / 2A.2: Eject, 2A.2a: Display Cancel
State: Idle

Event: 2.5, 2.7A.10: PIN Entered / 2.6, 2.7A.11: Validate PIN
Action: 2.7A.2: Invalid PIN / 2.7A.3: Invalid PIN Prompt
State: Waiting for PIN

Event: 2.7 [Valid]: Valid PIN / 2.8: Display Menu, 2.8a: Update Status
Action: 2.7C: Card Stolen, Card Expired / 2.7C.1: Confiscate, 2.7C.1a: Update Status
State: Validating PIN

Event: 2.7B: Third Invalid PIN / 2.7B.1: Confiscate
Action: 2.7B: Third Invalid PIN / 2.7B.1: Confiscate
State: Confiscating

Event: Processing Customer Input
Action: Waiting for Customer Choice
State: Waiting for Customer Choice
STATECHARTS

- State: a recognizable situation that exists over an interval of time
- Event: input to state machine that causes transition
- Action (optional): output generated by system when state transition occurs
LIFECYCLES

- State charts can be used to depict the lifecycle of an element.
COMPONENTS AND CONNECTORS

Connector Instance

Port Instance

Component Instance

Binding
COMPONENTS AND CONNECTORS

- Components: the principle computation elements and data stores that execute in a system; instance, not type

- Connector: a runtime *pathway of interaction* between two or more components

- Port: communication that occurs into or out of a component
CONNECTORS

- Simplest example: method call
- But also **any** other way components interact

<table>
<thead>
<tr>
<th>Connector type</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local procedure call</td>
<td>Most common connector when components are all in the same memory space.</td>
</tr>
<tr>
<td>Remote procedure call</td>
<td>Concrete examples include SOAP and HTTP requests. Both local and remote procedure call connectors are kinds of request-reply connectors.</td>
</tr>
<tr>
<td>SQL or other datastore</td>
<td>Declarative language used to load/store data.</td>
</tr>
<tr>
<td>Pipe</td>
<td>Simple producer-consumer relationships between components.</td>
</tr>
<tr>
<td>Shared memory</td>
<td>Fast but complex communication.</td>
</tr>
<tr>
<td>Event broadcast</td>
<td>Consumers depend only on events, not on producers.</td>
</tr>
<tr>
<td>Enterprise bus</td>
<td>Standardizes intra-application communication for assembly of large systems.</td>
</tr>
<tr>
<td>Data drop</td>
<td>Distribution mechanism for shared data from single source.</td>
</tr>
<tr>
<td>Incremental replication</td>
<td>Handles state synchronization.</td>
</tr>
</tbody>
</table>
PORTS

- Could be a group of related public methods
  - e.g., a Java Element implements IRunnable interface, which becomes a port

- Could be a communication modality
  - e.g., interaction that HTTP requests, database, event system
**EXAMPLE**

- **Behavior:**
  - add copy
  - remove copy
- **Information:**
  - Library
  - Copy
  - Book
- **Not needed:**
  - Loan
  - Borrower

**Information model** of the port: What the user must understand to use the port’s operations

![Diagram](attachment:diagram.png)
EXAMPLE

Describe the pros and cons of using each tool to model the architecture of your next project.

In many cases, general-purpose drag-and-drop models are much wider than target audience.
Expressive power is stronger because there are no rules or restrictions.
Some of general-purpose domain models are read once but never get trained or help from many people.
Maintaining architecture is not possible.

Several view types can be mixed in one diagram because there are no restrictions.
INTERROGATING A DESIGN MODEL

- Just like domain model, want to understand if a design supports a scenario
- As you simulate each step in the scenario, does your design still work?
  - Are there additional elements or relationships you should add?
  - Is there a way to your design can support the scenario more simply?
USING DESIGN NOTATIONS

- Notation offers a view with which to see design
  - Key choice is what part of design do you want to focus on
- Modeling activities can be driven by risk
  - What are you worried about not working
  - What do you need to model to reduce this risk
- Might be possible to reduce by building a model; or by building an implementation
CHOICE OF ABSTRACTION LEVEL

- Systems are hierarchic, where elements contains elements which contain elements
- How deep you choose to go should depend on what you are trying to model and understand it
  - If you don't need some detail, don't include it!
- May end up with very different models of the same thing depending on what you are trying to understand about it
NOTATIONS AS STARTING POINTS

- If you need to express something that's not in your modeling notations, it's ok to create new notation.
- Can change visual variables of marks to communicate information:
  - e.g., color, shape, dashing
  - Black edges are method call connectors and green edges are HTTP request connectors.
- Can add annotations (i.e., text) to elements or relations to explain constraints or decisions:
  - e.g., this port is only available after system initialization.
SUMMARY

- Design notations help to think through a design
- Many choices about what to show
  - One config of the system or all
  - Steps in a sequence of a process or snapshot
  - Element as a black box or with internals visible
- Often start with a scenario or risk, want to understand how to support the scenario or reduce the risk through a design
IN CLASS ACTIVITY
DESIGN ACTIVITY: PLUGIN ARCHITECTURE

Your goal: design a plugin architecture for a drawing application

In a plugin architecture, plugins are

- written by third parties (i.e., not you)
- dynamically loaded at runtime into your application
- invoked through an interface, without knowing anything about implementation

Deliverables:

- component and connector model showing elements in your system and where plugins can connect
- state chart describing the lifecycle of a plugin
