User-Centered Design

SWE 632 Fall 2023

Administrivia

- HW1 due next Tuesday before class
- Anyone still looking for a Tech Talk group?

What We Learned & Looking Ahead

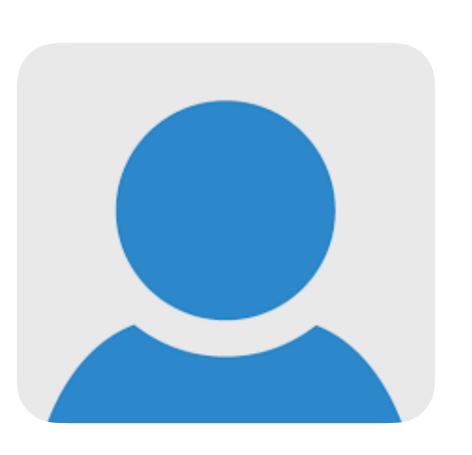

- Examined human cognition
- Have 2 ways to identify usability issues (Heuristics & Principles)
- But... is HCl just identifying usability issues?
- What does <u>design</u> mean?
- How do we learn about user <u>needs</u>?
- How do we build designs?
- How do we evaluate designs?

Overview of User-Centered Design

In Class Discussion

- Today's question:
 - What does user-centered design mean to you?

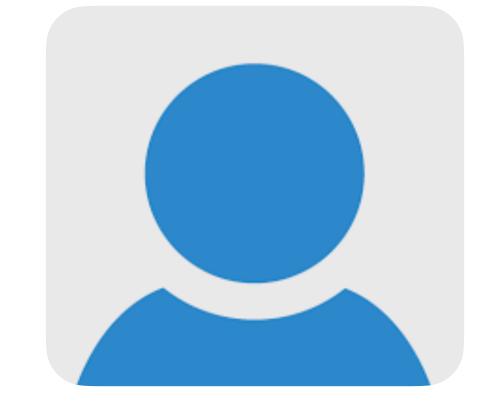

User-centered design

User-centered design

Who are the users?

What are the user's needs?

How does the product fit into the broader context of their lives?

What problems may users encounter w/ current ways of doing things?

What are the user's tasks and goals?

What extreme cases may exist?

Technology-Centered Design

What can this technology do?

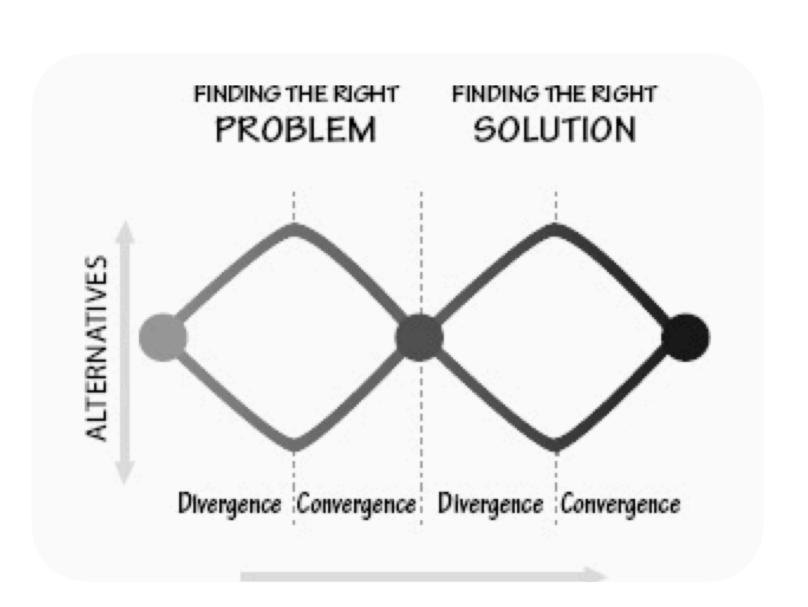

How might users use it?

What features does it have?

Double Diamond Model of Design

- Question problem, expand scope, discover fundamental issues
- Converge on problem
- Expand possible solutions
- Converge on solution

Iterative Model of Design

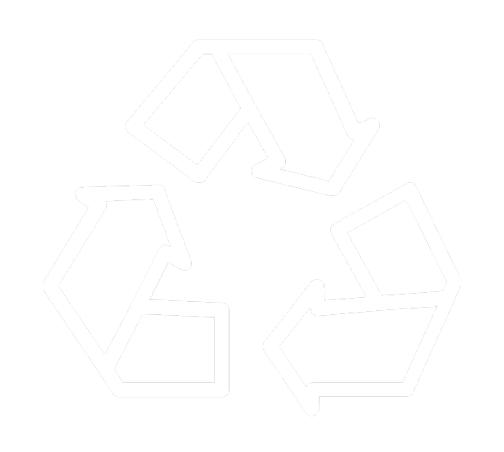

Observation

(Re)Define the Problem

Understand User Needs

<u>Test</u>

Evaluate what you have built

Idea Generation

Brainstorm what to build

<u>Prototype</u>

Build

Iteration, Iteration, Iteration

- Repeated study and testing
- Use tests to determine what is working or not working
- Determine what the problem might be, redefining the problem
- Collect more data
- Generate new alternatives

Observation

Needfinding (a.k.a. design research)

- Goal: understand user's needs
- Use of methods to gather qualitative data
 - behaviors, attitudes, aptitudes of potential and existing users
 - technical, business, and environmental contexts domain
 - vocabulary and social aspects of domain
 - how existing products used
- Empowers team w/ credibility and authority, helping inform decisions

Needfinding vs. market research

Needfinding

- What users really need
- How they will really use product
- Qualitative methods to study in depth
- Small numbers of participants

Market research

- Who might purchase item
- What factors influence purchasing
- Quantitative studies w/ focus groups, surveys
- Large numbers of participants

Example

- Cooper conducted a user study for entry-level video editing product
- · Company built professional software, looking to move into consumer software
 - Help connect those w/ computers and video cameras
- Found strongest desire for video editing was parents
- Found 1/12 had successfully connected camera, using work IT guy

Solving the correct problem

- Practices may sometimes mask deeper problems
- Goal: uncover layers of practices to understand how problems emerge

Interviews

- May include bother current users and potential users w/ related needs
- Questions
 - context of how product fits into lives or work
 - when, why, how is or will product be used
 - what do users need to know to do jobs?
 - current tasks and activities, including those not currently supported
 - goals and motivations of using product
 - problems and frustrations with current products or systems

Observations

- Most incapable of accurately assessing own behaviors
- May avoid talking about problems to avoid feeling dumb
- Observing yields more accurate data
- Capture behaviors: notes, pictures, video (if possible)

Contextual inquiry

- Method that includes both interviews and observations
- Next week's lecture

Idea Generation

Creativity

- What's the most creative software app you've seen?
- What made it creative?

Ideation

- Process of generating, developing, communicating new ideas
- Guidelines and best practices
 - Generate *numerous* ideas
 - Number ideas
 - Avoid premature dismissal of ideas
 - Sharpen the focus pose the right problem
 - Build and jump build to keep momentum on ideas, jump when theme tapers out

Prototyping

Prototyping - Building Quickly

- Build quick prototype or mock-up of each potential solution
- "Wizard of Oz" Studies
- Mainly performed to ensure the problem is well understood

Testing

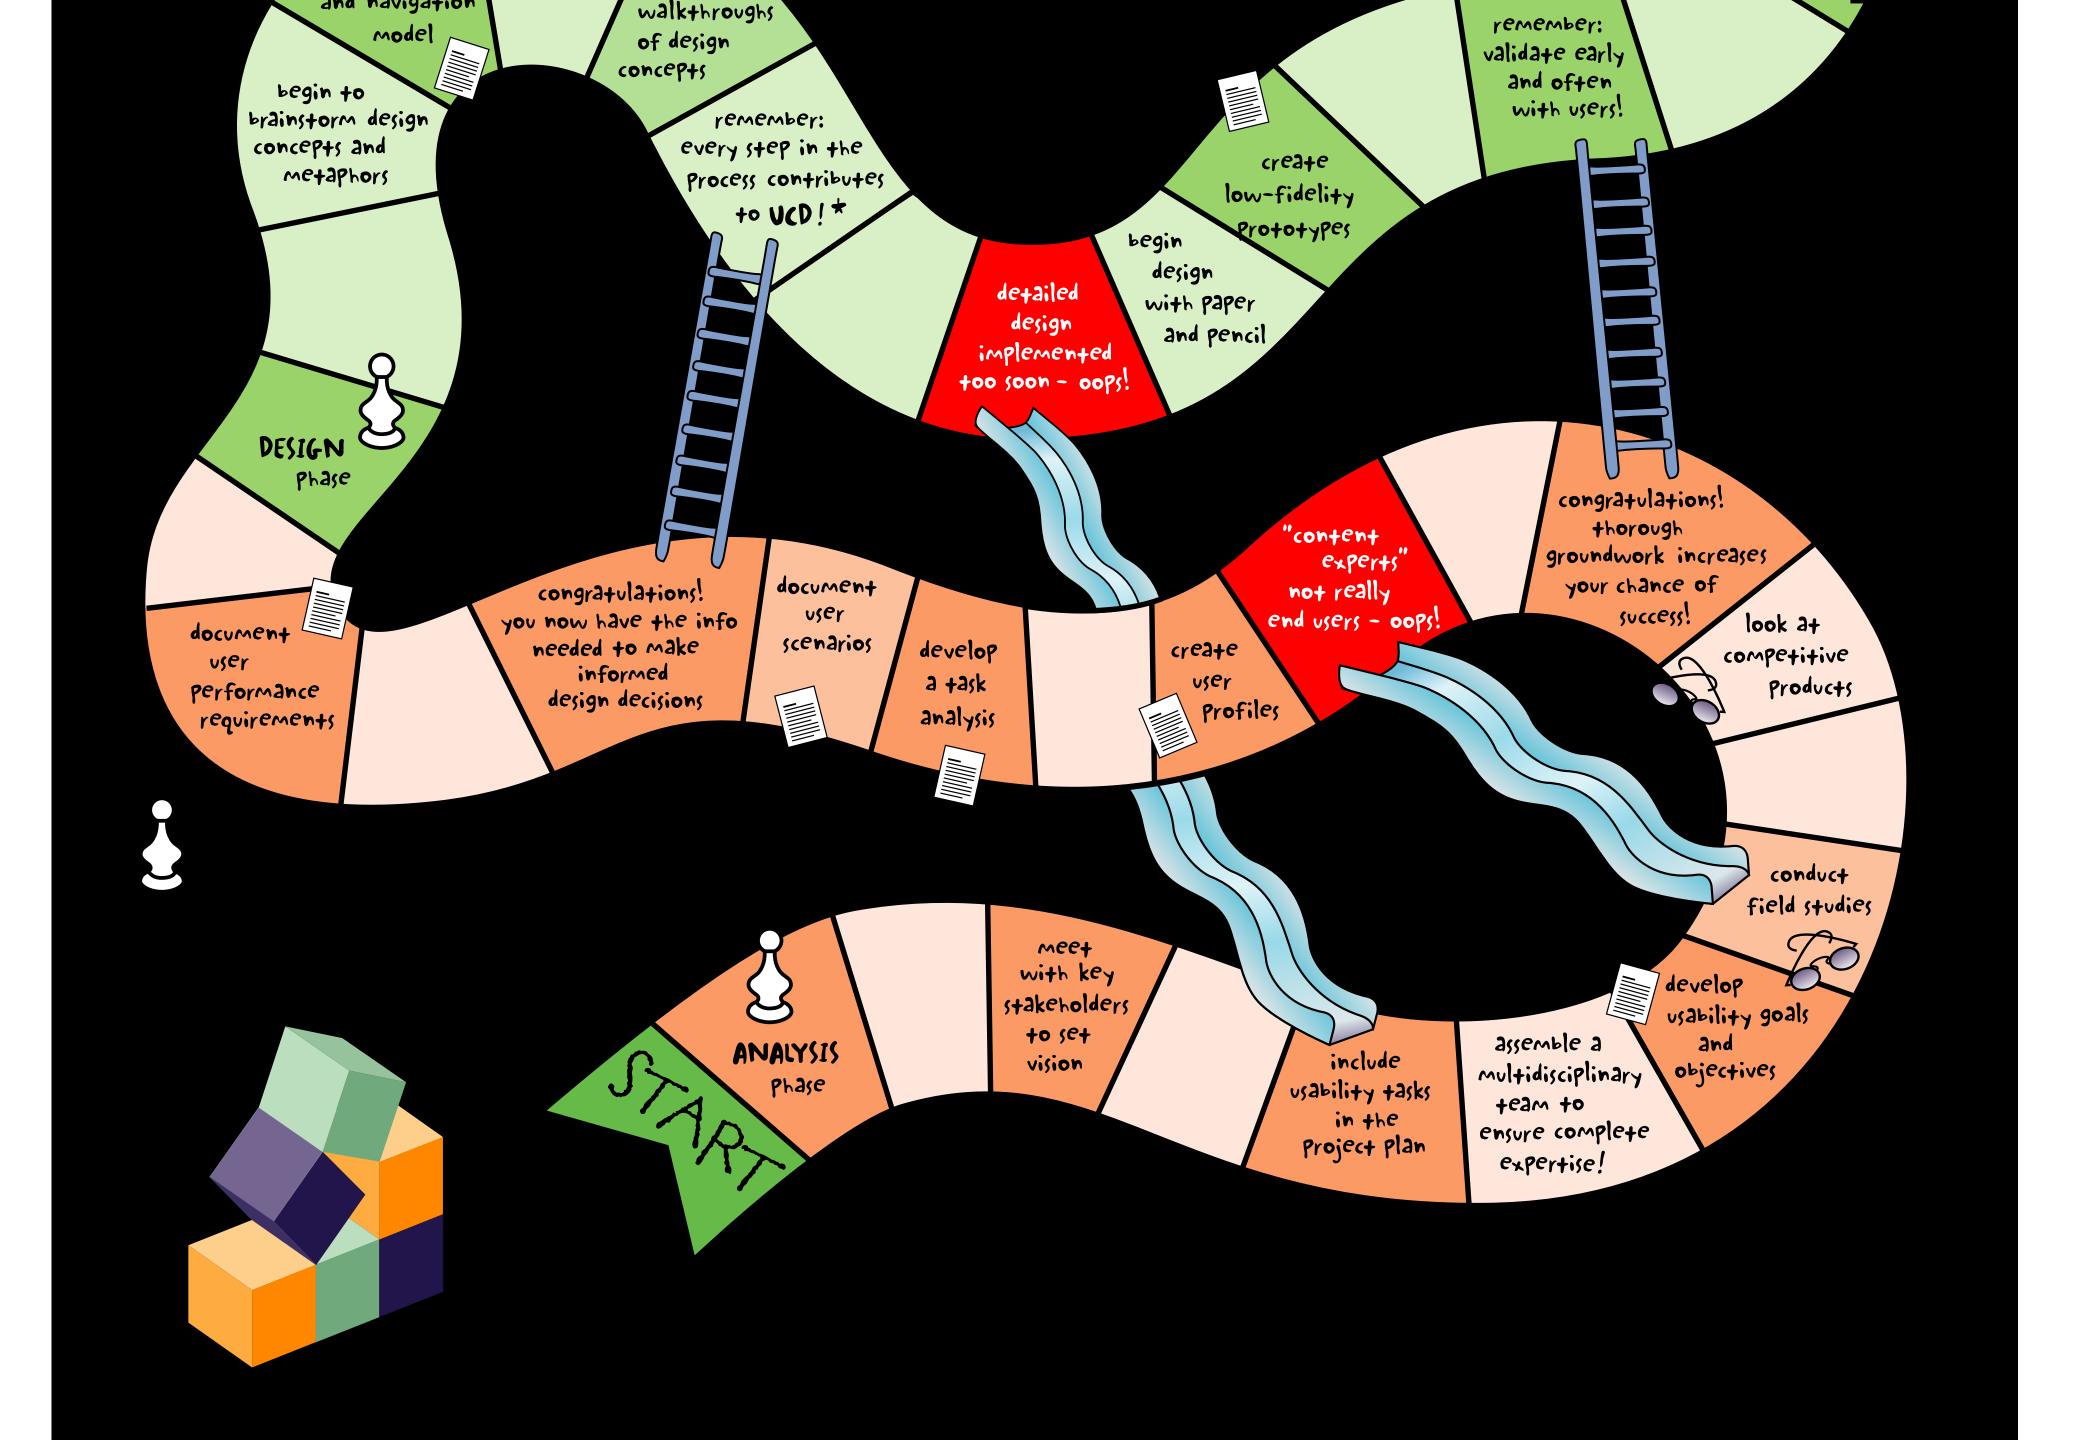

Testing - User Centered Evaluation

- Test with population similar to target population
- Have them use prototypes as close as possible to intended
- If possible, have two people use a prototype, one guiding the other's use.
- More on this in a future lecture...

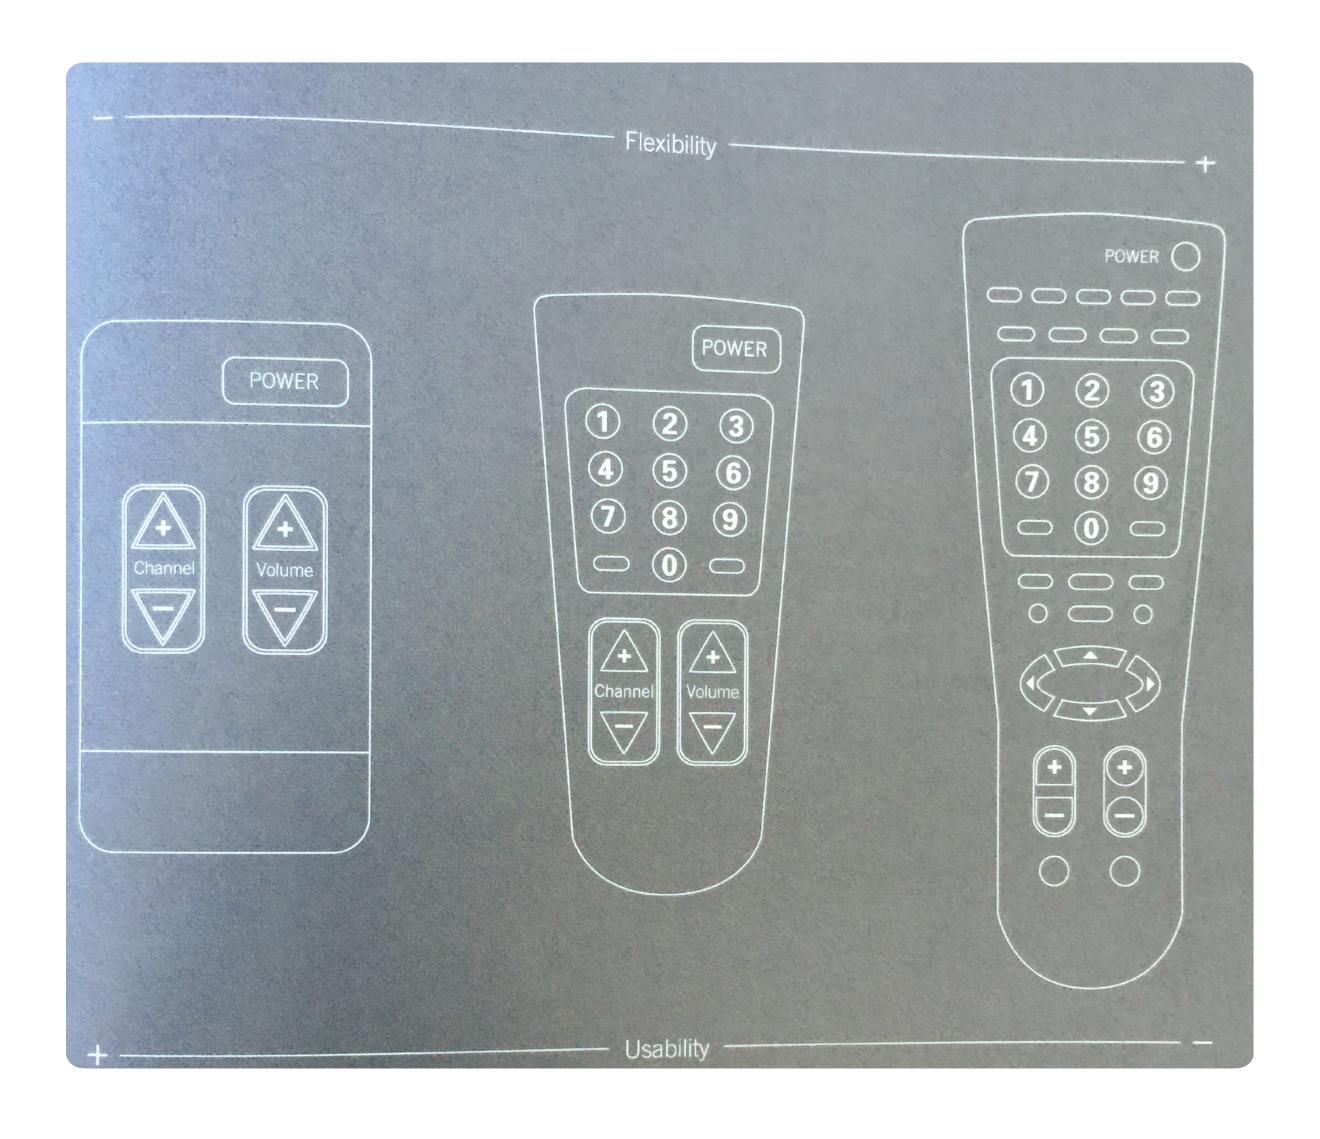

User-Centered Design Considerations

Fail Fast

- "Fail frequently, fail fast" David Kelley, founder of Ideo
- Failure is *learning* experience
- Crucial to understand correct <u>problem</u> to solve & ensure solution is appropriate
- Abstract requirements are invariably wrong
- Requirements produced by asking people what they want are wrong

Flexibility-usability tradeoff

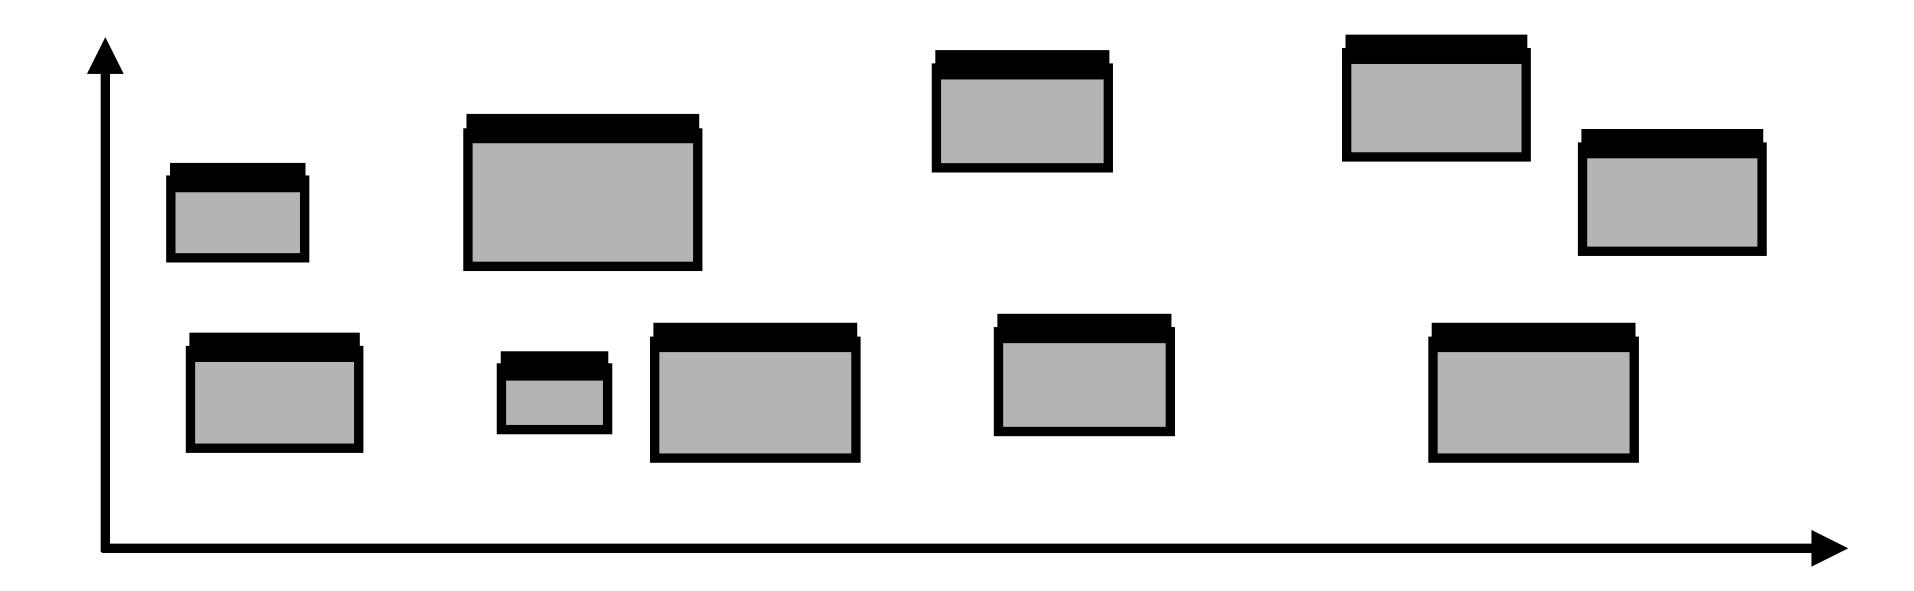

Flexibility-Usability Tradeoff

- Jack of all trades, master of none
- Better understanding needs enables specialization and optimization for common cases
- System evolution over time:
 - flexibility —> specialization

Examples of flexibility / usability tradeoff?

Navigating Design Space

- What are key decisions in interaction design?
- What alternatives are possible?
- What are tradeoffs between these alternatives?

Hierarchy of Design Decisions

- What are you (re)designing?
 - The width of the text input
 - The maximum length of a valid username
 - When in the signup process users enter their username
 - If the user must create a username when signing up
 - Whether users are anonymous or have a login
 - If users can interact with other users in your application

Picking the Right Level of Redesign

- Where are the user's pain points
- What are the underlying causes
- What would be the value to the user of addressing issue
- What do you have time to build (or change)

Example - iPod

- Supports entire activity of listening to music
 - discovering music
 - purchasing music
 - getting it into music player
 - developing playlists
 - sharing playlists
 - listening to music
 - ecosystem of external speakers and accessories

Example of a Design Process

- How do you get from let's make listening to music better to designing an iPod??
- Iterative design...
 - But what does that actually look like more concretely?
 - What insights into activity help inspire design?
 - How does watching users help lead to these insights?
 - How do insights translate into an actual real design?
 - How do know the new design is actually better?

In-Class Activity

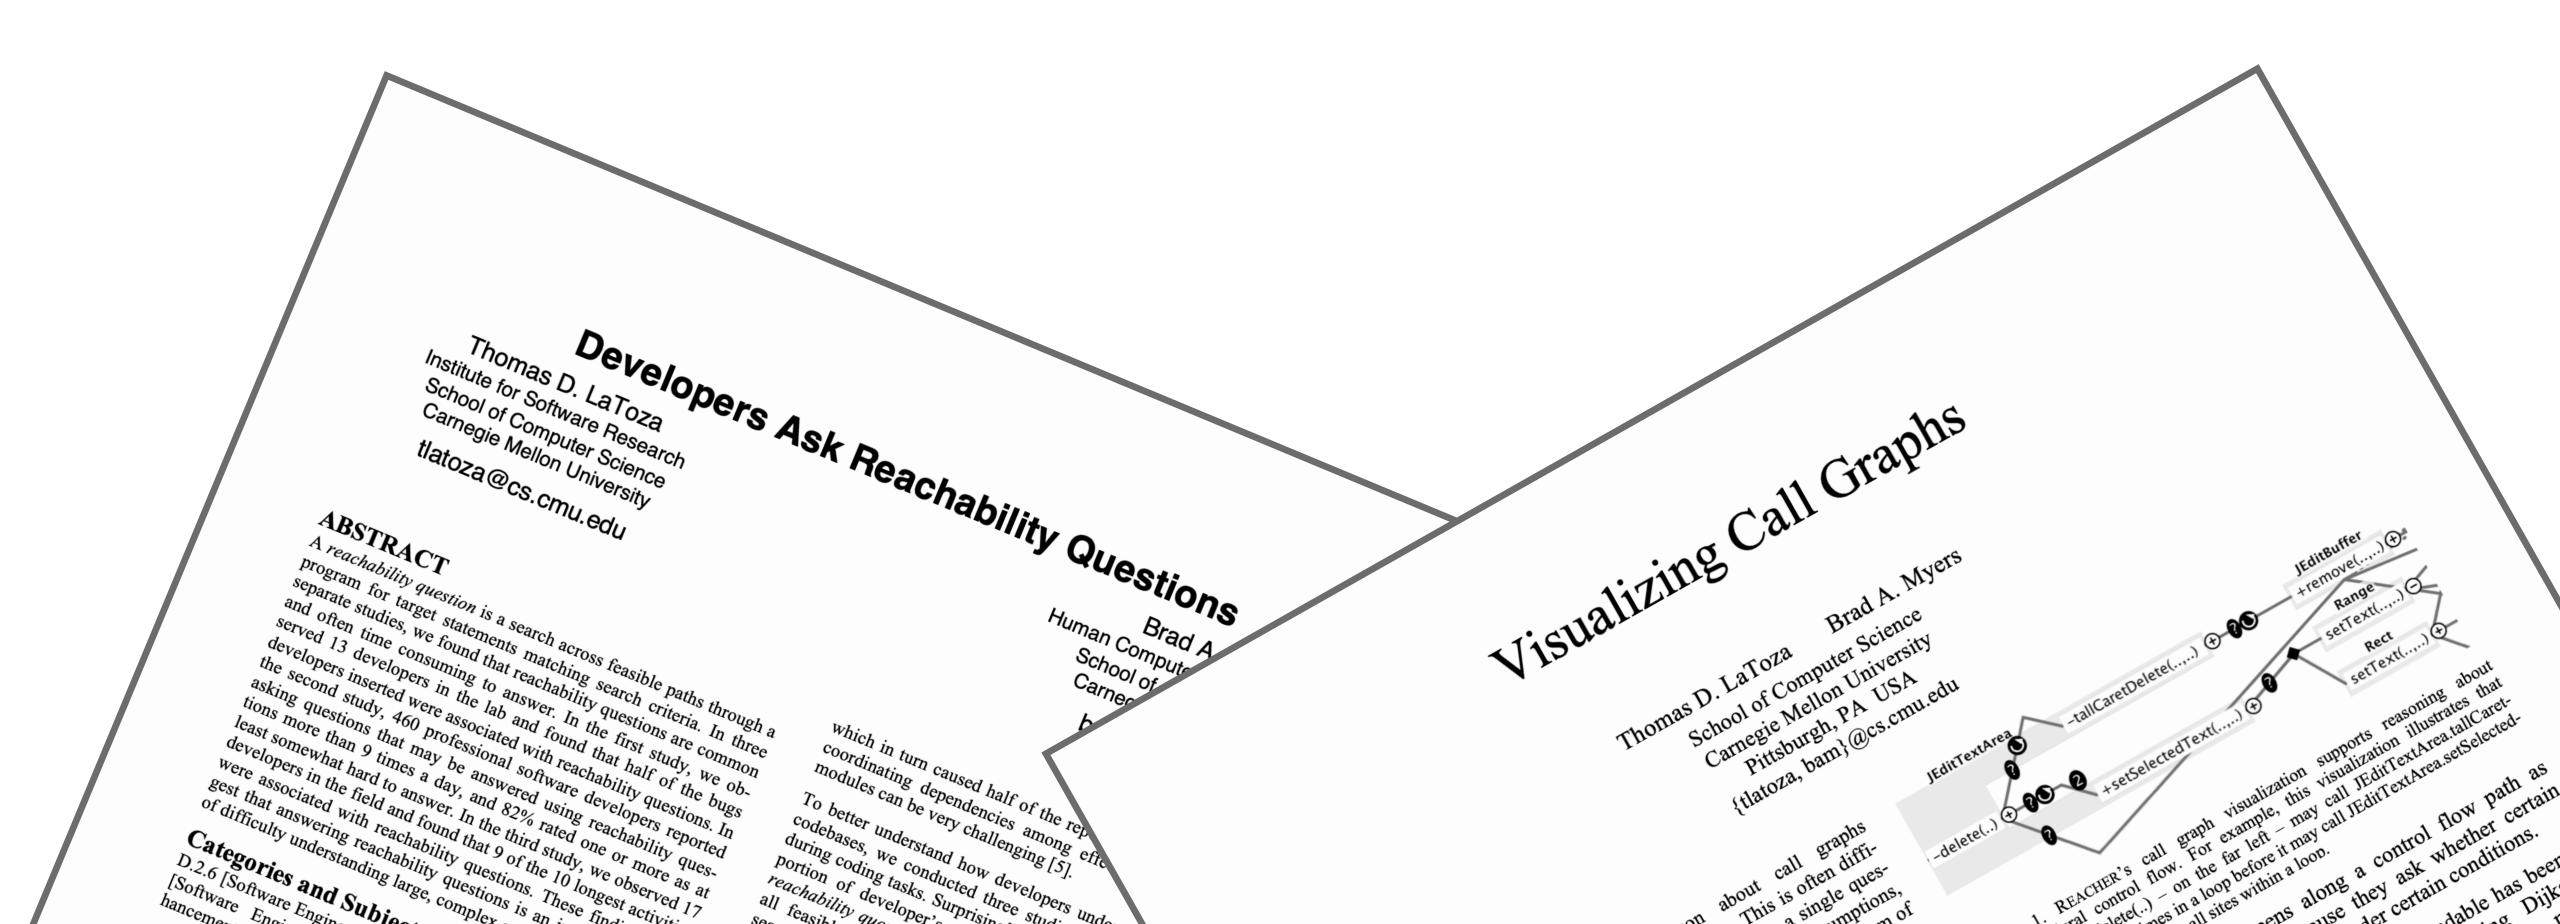

- Redesign PatriotWeb
- Consider: at what level are you redesigning it? What's the problem (at this level)? How are you making it better?

Example

Domain: Debugging

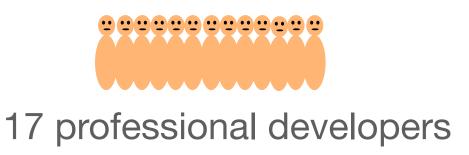

- <u>Design goal</u>: how do we better support activity of debugging in large, complex codebases?
- Build a better debugging tool (?)
 - What should it do? How would it help?
 - Design a better watch window? Support new types of breakpoints?
 - What's really the key steps in debugging that lead users to struggle the most?

Domain: Debugging

Observing Developers

Participants

Tasks

~90 minutes picked one of *their* own coding tasks involving unfamiliar code

Interesting. This looks like, this looks like the code is approximately the same but it's refactored. But the other code is.

Changed what flags it's ???

He added a new flag that I don't care about. He just renamed a couple things.

Transcripts

Well.

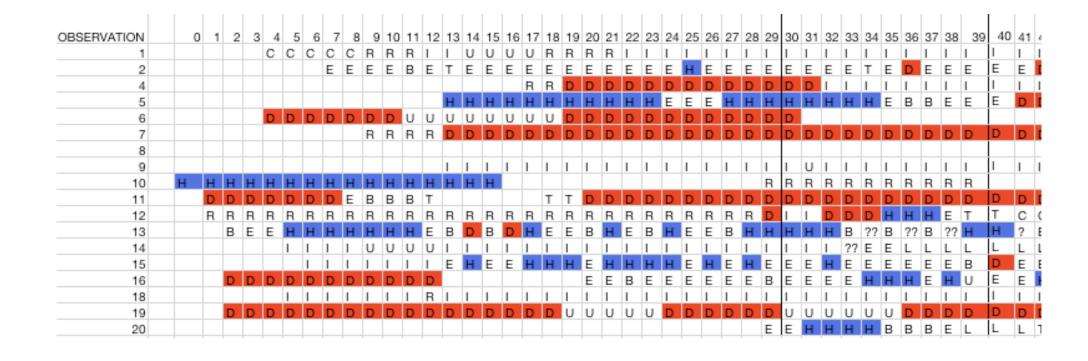

So the change seemed to have changed some of the way these things are registered,

but I didn't see anything that talked at all about whether the app is running or whether the app is booted. So it seems like, this was useless to me.

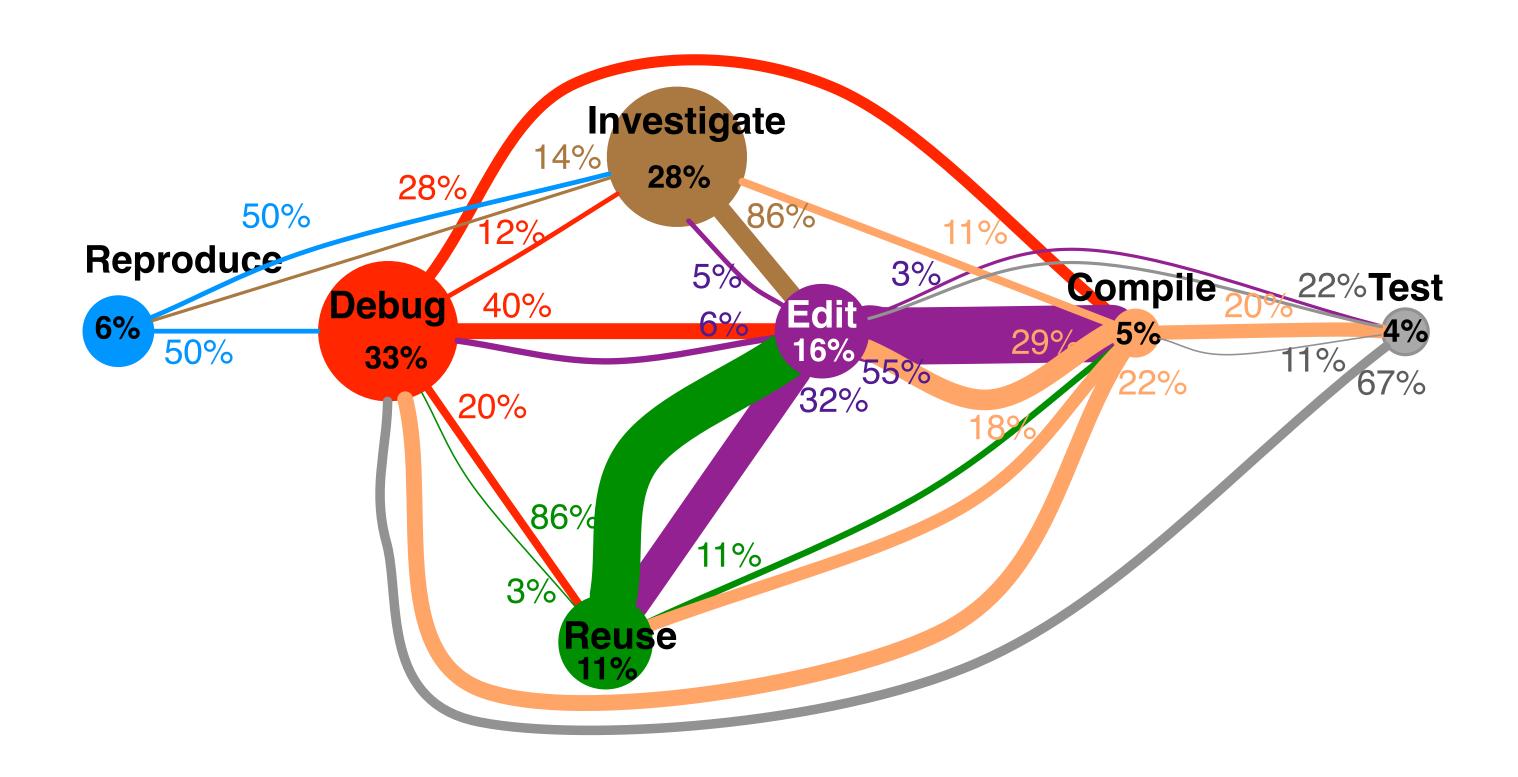

(annotated with observer notes about goals and actions)

(386 pages)

Activities

Coding Activities

Circle size: % of time Edge thickness: % of transitions observed

Longest Activities: Control Flow

4 out of the 5 longest investigation activities

| Primary question | Time (m) | Related control flow question |
|--|-------------------|---|
| How is this data structure being mutated in this code? | 83 Sea | ch downstream for writes to data structure |
| "Where [is] the code assuming that the tables are already there?" | ₅₃ Con | pare behaviors when tables are or are not loaded |
| How [does] application state change when <i>m</i> is called denoting startup completion? | 50 Find | field writes caused by m |
| "Is [there] another reason why status could be non-zero?" | 11 Find | statements through which values flow into status |

5 out of the 5 longest debugging activities

| Where is method <i>m</i> generating an error? | 66 Search downstream from <i>m</i> for error text |
|--|--|
| What resources are being acquired to cause this deadlock? | Search downstream for acquire method calls |
| "When they have this attribute, they must use it somewhere to generate the content, so where is it?" | 35 Search downstream for reads of attribute |
| "What [is] the test doing which is different from what my app is doing?" | 30 Compare test traces to app traces |
| How are these thread pools interacting? | 19 Search downstream for calls into thread pools |

Longest Debugging Activities

Where is method m generating an error?

Rapidly found method *m* implementing command Unsure *where* it generated error

Static call traversal

Statically traversed calls looking for something that would generate error

Debugger

Tried debugger

Grep

Did string **search** for error, found it, but many callers

Debugger

Stepped in debugger to find something relevant

Static Call Traversal

Statically *traversed* calls to explore

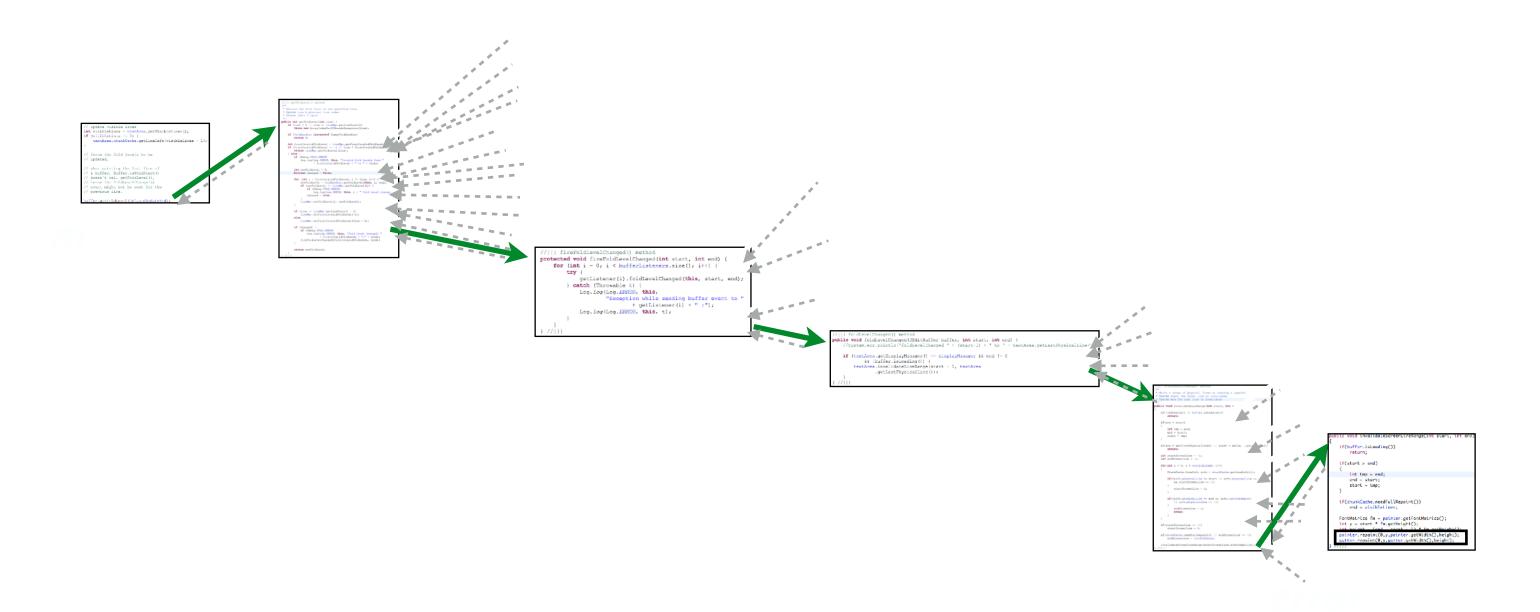

Debugger

Went back to *stepping* debugger to inspect values Found the answer

(66 minutes)

Why was this Hard to Answer?

Hard to pick the *control flow path* that leads from starting point to target Guess and check: which path leads to the target?

Why are Control Flow Questions Common?

Helps answer questions about:

Causality What does this do? What causes this to happen?

Ordering Does A happen before B?

Choice Does x always occur? In which situations does x occur?

When scattered across a codebase, finding statements to answer these questions can be hard.

lab observations

Defect-related false assumptions & incorrectly answered questions related to **control flow**

field observations

Primary questions from longest investigation & debugging activities related to **control flow**

lab observations

Defect-related false assumptions & incorrectly answered questions related to **control flow**

field observations

Primary questions from longest investigation & debugging activities related to **control flow**

Reachability Questions

(common characteristics of evidence sought)

A search along feasible

paths downstream or

upstream from a

statement for target

statements matching

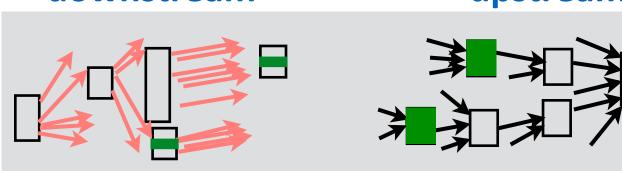

search criteria

feasible paths

filter compare

downstream

upstream

search criteria

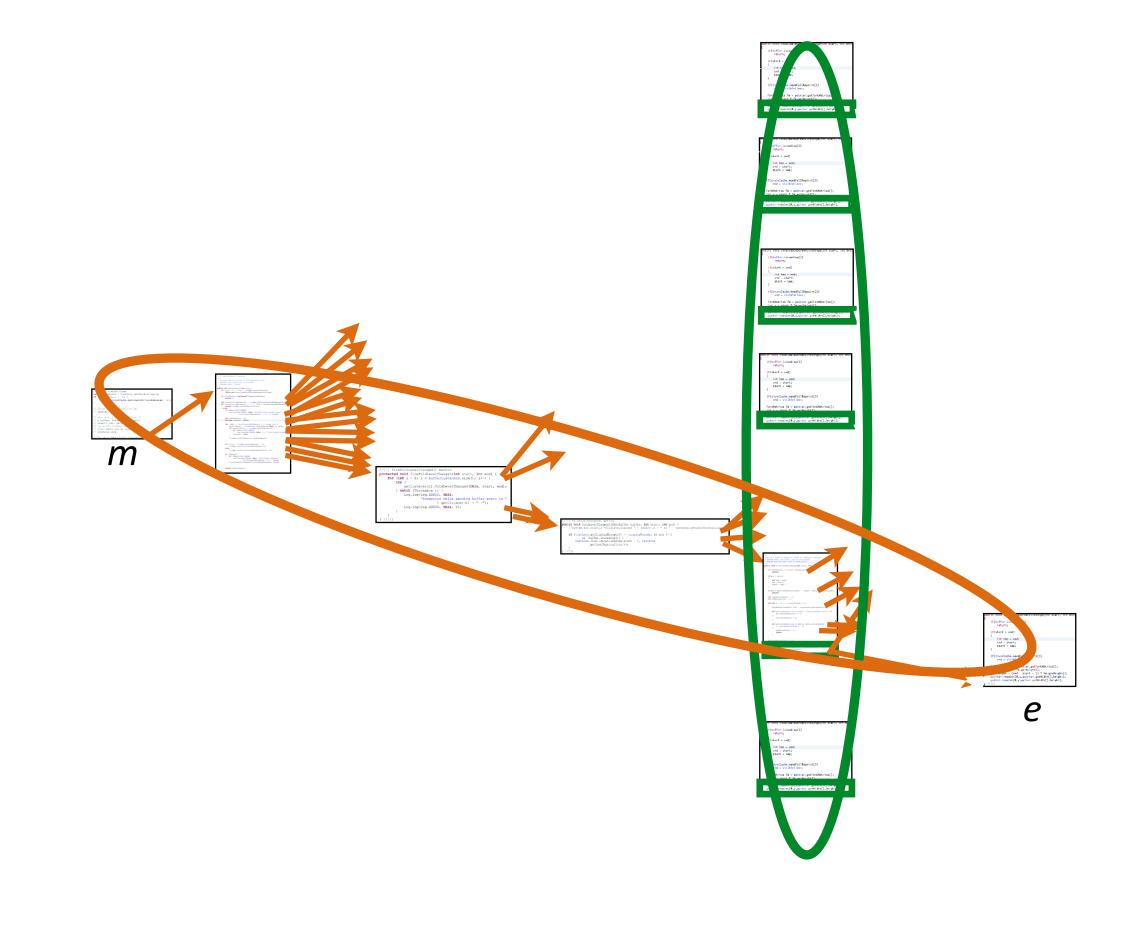

identifier statement type (field write/read, library call)

feasible naths

statements matching search criteria

Reachability Question Example

A search along feasible paths downstream or upstream from a statement (m) for target statements matching search criteria (calls to method e)

feasible paths statements matching search criteria

Longest Activities: Control Flow

4 out of the 5 longest investigation activities

| Primary question | Time (m) | Related control flow question |
|--|-------------------|--|
| How is this data structure being mutated in this code? | 83 Sea | rch downstream for writes to data structure |
| "Where [is] the code assuming that the tables are already there?" | ₅₃ Con | npare behaviors when tables are or are not loaded |
| How [does] application state change when <i>m</i> is called denoting startup completion? | 50 Find | field writes caused by m |
| "Is [there] another reason why status could be non-zero?" | 11 Find | statements through which values flow into status |

5 out of the 5 longest debugging activities

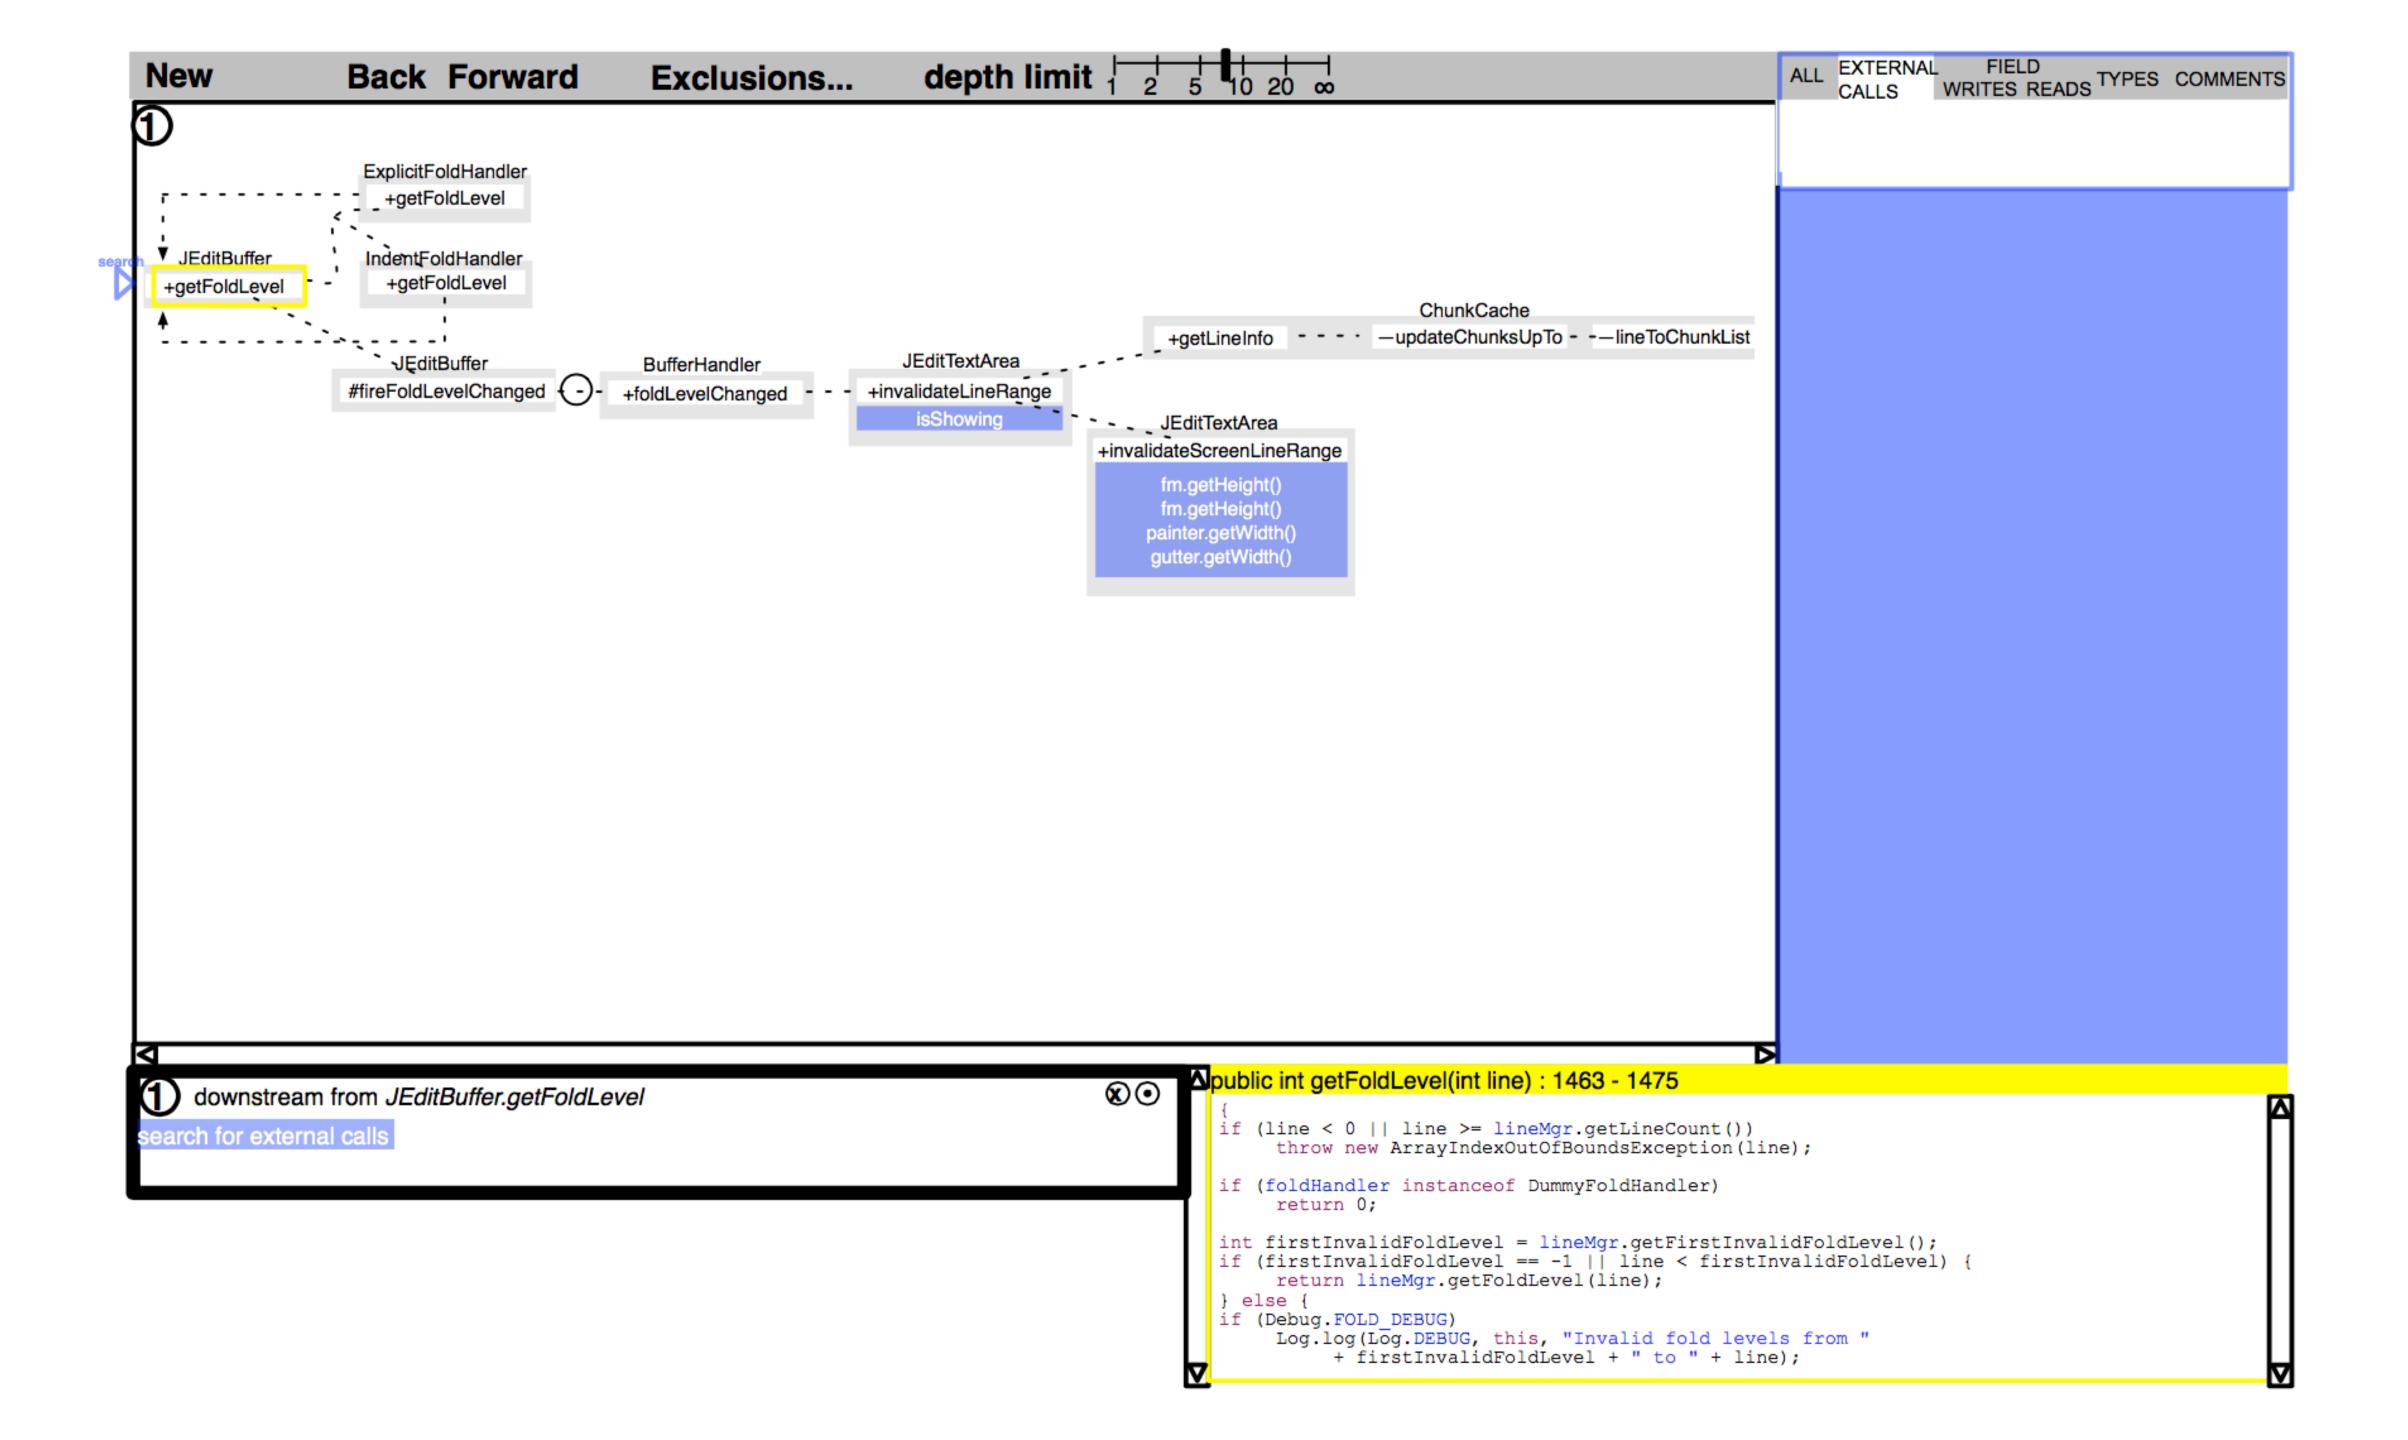

| Where is method m generating an error? | 66 Search downstream from <i>m</i> for error text |
|--|--|
| What resources are being acquired to cause this deadlock? | Search downstream for acquire method calls |
| "When they have this attribute, they must use it somewhere to generate the content, so where is it?" | 35 Search downstream for reads of attribute |
| "What [is] the test doing which is different from what my app is doing?" | 30 Compare test traces to app traces |
| How are these thread pools interacting? | 19 Search downstream for calls into thread pools |

Insights

 Developers can construct <u>incorrect</u> mental models of control flow, leading them to insert **defects**

 The <u>longest</u> investigation & debugging activities involved a single primary question about control flow

Found evidence for an underlying cause of these difficulties
 Challenges answering <u>reachability questions</u>

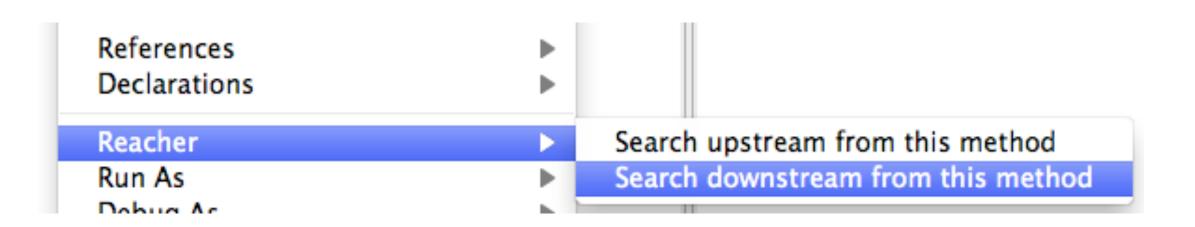

Paper Prototype Study

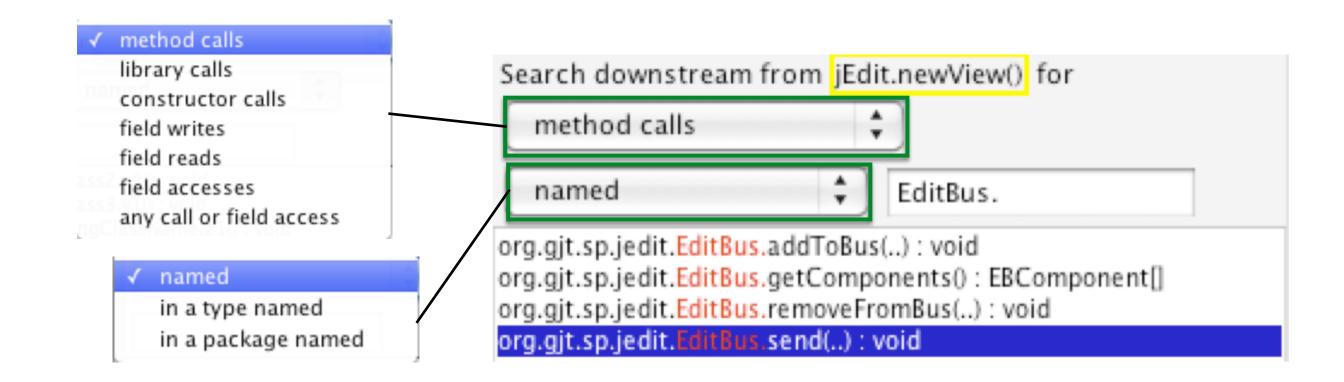

- Built mockups of interface for task from lab study
- Asked 1 participant to complete lab study task with Eclipse & mockup of Reacher
 - Paper overlay of Reacher commands on monitor
 - Experimenter opened appropriate view
- Asked to think aloud, screen capture + audio recording

Study results

- Used Reacher to explore code, unable to complete task
- Barriers discovered
 - Wanted to see methods before or after, not on path to origin or destination
 - Switching between downstream and upstream confusing, particularly search cursor
 - Found horizontal orientation confusing, as unlike debugger call stacks
 - Wanted to know when a path might execute

Find Statements Matching Search Criteria

| Examples of observed reachability questions Reacher supports | Steps to use Reacher |
|--|--|
| What resources are being acquired to cause this deadlock? | Search downstream for each method which might acquire a resource, pinning results to keep them visible |
| When they have this attribute, they must use it somewhere to generate the content, so where is it? | Search downstream for a field read of the attribute |
| How are these thread pools interacting? | Search downstream for the thread pool class |
| How is data structure <i>struct</i> being mutated in this code (between <i>o</i> and <i>d</i>)? | Search downstream for <i>struct</i> class, scoping search to matching type names and searching for field writes. |
| How [does] application state change when <i>m</i> is called denoting startup completion? | Search downstream from <i>m</i> for all field writes |

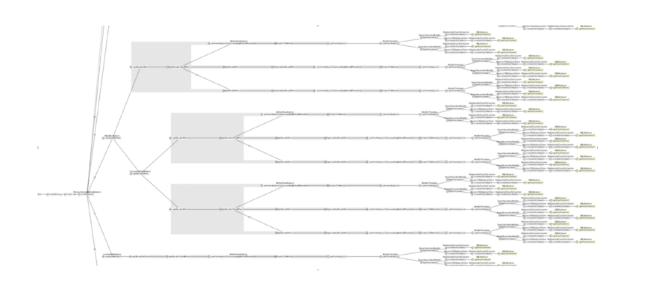

Help Developers Understand Paths

Goal: help developers reason about control flow by summarizing statements along paths in **compact** visualization

Challenges:

control flow paths can be

Approach:

complex

long

repetitive

visually encode properties of path

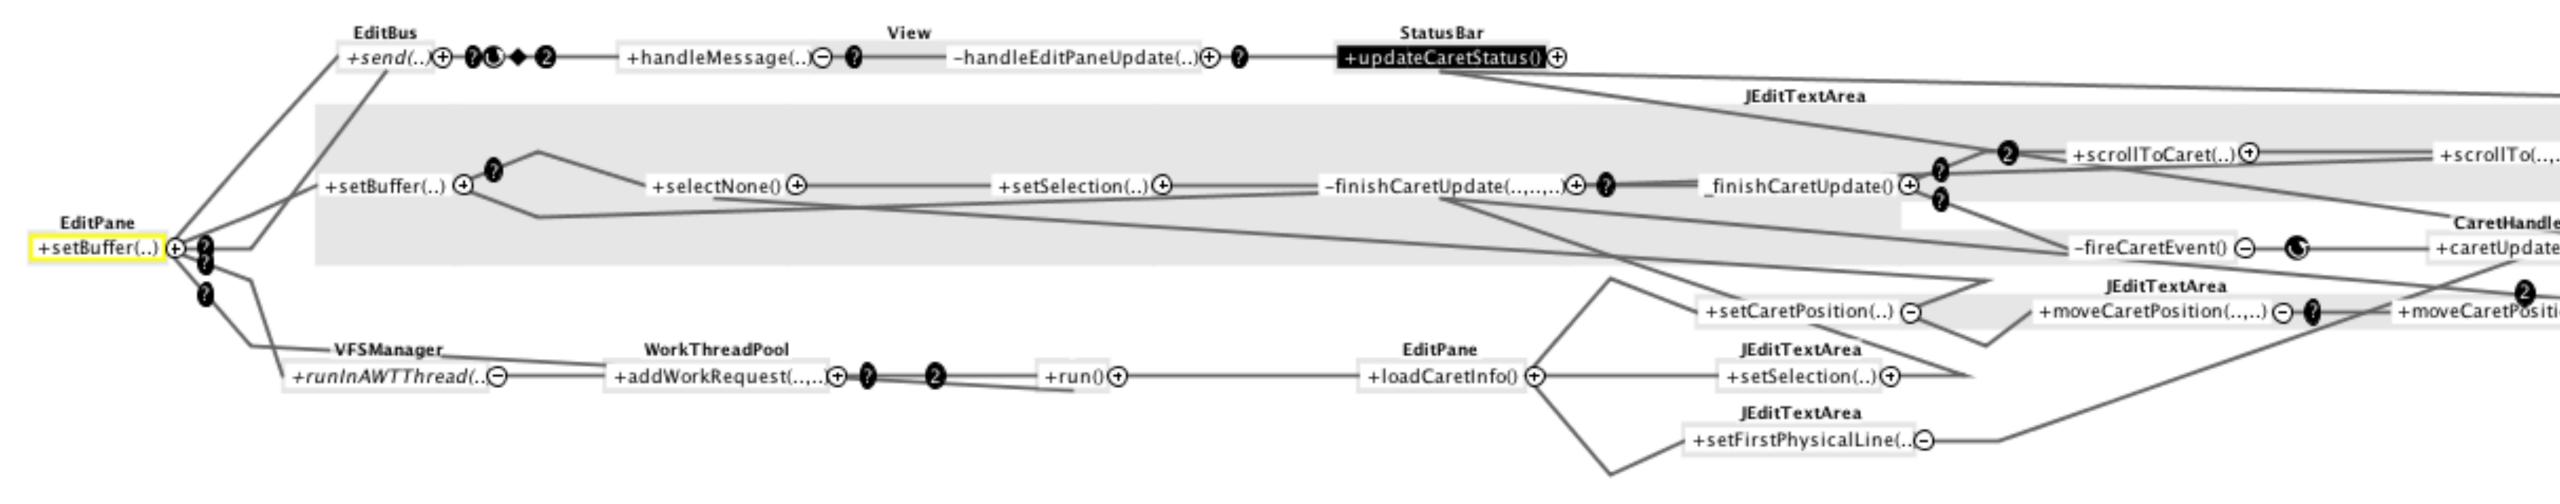

hide paths by default

coalesce similar paths

developers get lost and disoriented navigating code

use visualization to support navigation

Example

Evaluation

Does REACHER enable developers to answer reachability questions faster or more successfully?

Method

12 developers 15 minutes to answer **reachability** question x 6

Tasks

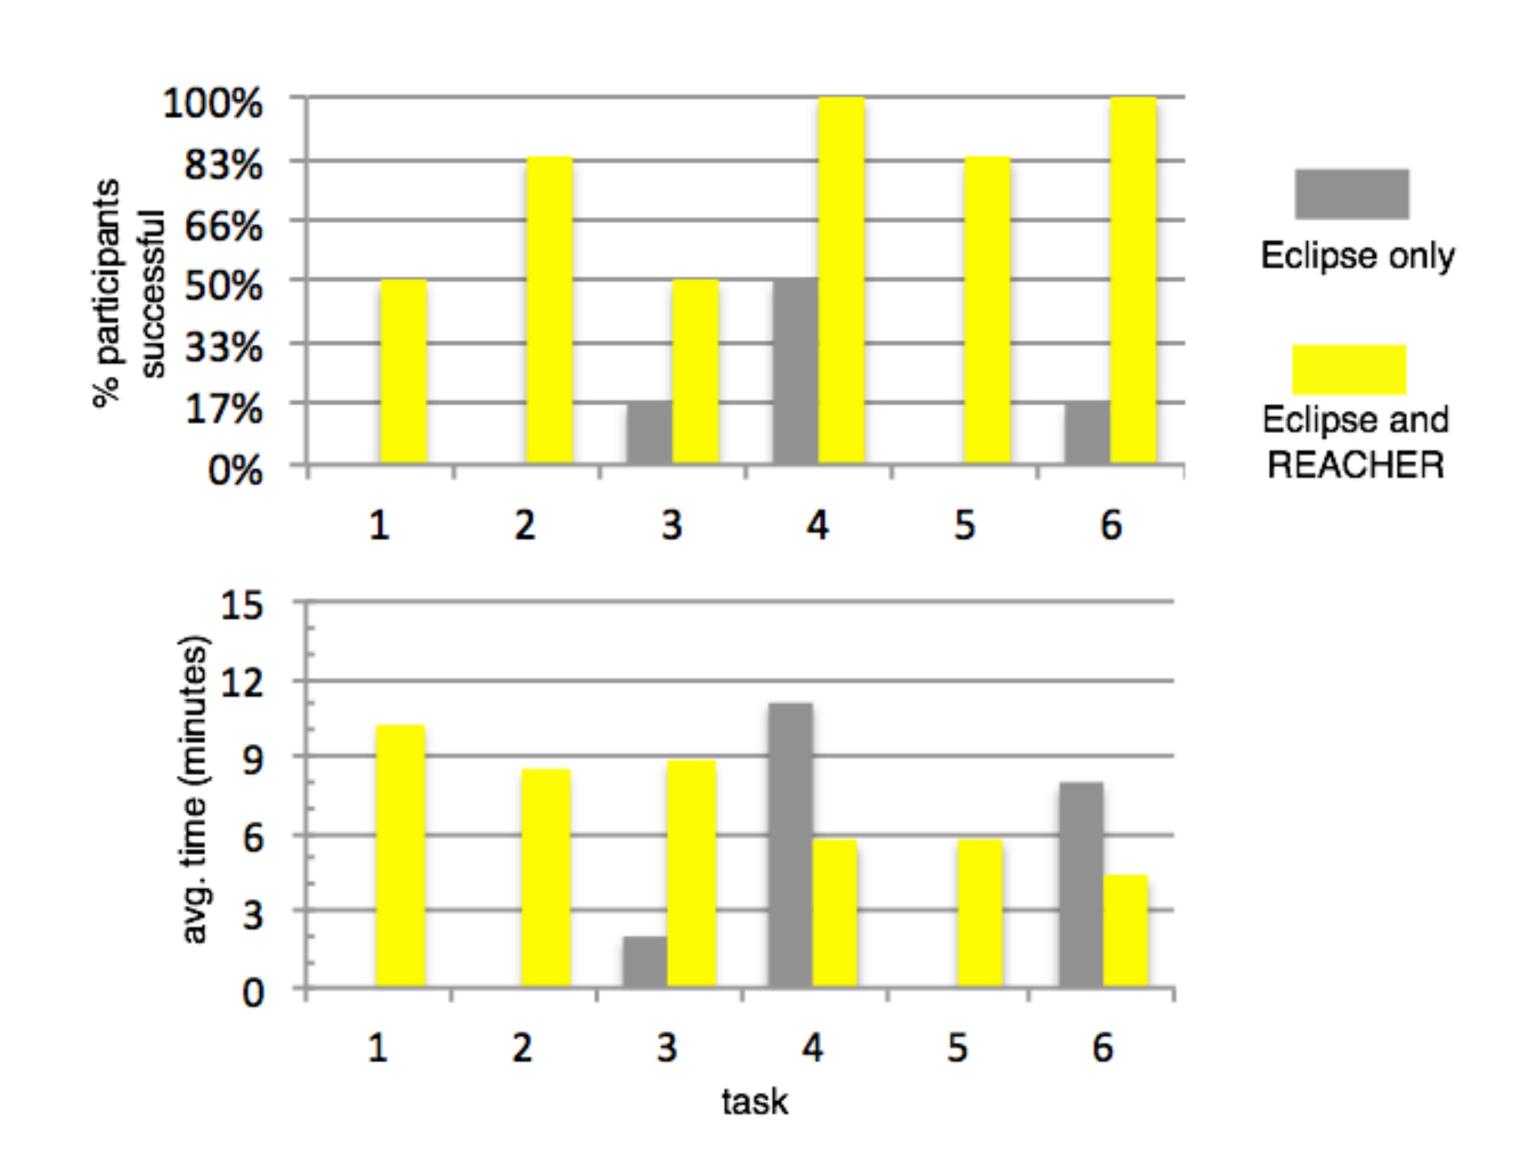

Based on developer questions in lab study.

Example:

When a new view is created in jEdit.newView(View), what messages, in what order, may be sent on the EditBus (EditBus.send())?

Results

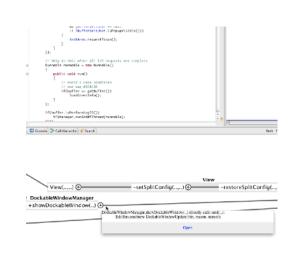

Developers with REACHER were **5.6** times more **successful** than those working with Eclipse only.

More Results

Participants with **REACHER** used it to jump between methods.

"It seems pretty cool if you can navigate your way around a complex graph."

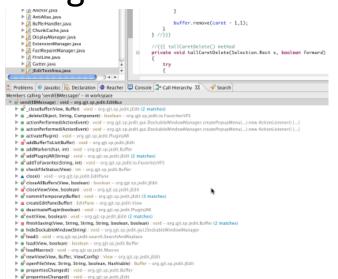

When **not** using Reacher, participants often reported being lost and confused.

"Where am I? I'm so lost."

"These call stacks are horrible."

"There was a call to it here somewhere, but I don't remember the path."

"I'm just too lost."

Participants reported that they liked working with REACHER.

"I like it a lot. It seems like an easy way to navigate the code. And the view maps to more of how I think of the call hierarchy."

"Reacher was my hero. ... It's a lot more fun to use and look at."

"You don't have to think as much."

Reflection on Design Process

- Started with a goal: make debugging in large, complex codebases better
- Observed users to build <u>insight</u> into what key challenge was
- Rather than address usability challenges of existing debugging tools, designed new way to debug
- Gathered evidence that it worked better

10 Minute Break

In-Class Activity

- Form groups of 2 or 3
- A venture capitalist just gave your group \$5M to build a new consumer software product (mobile, web, desktop, etc.)
- Brainstorm an idea: what's the product? how will it help?
- Deliverables. Answer the following questions:
 - What do you know now
 - Who are the users? What are their tasks and goals? What problems do they encounter?
 How will your tool help?
 - What would like to learn through needfinding that you don't already know?
 - How would you use an interview / survey / observations / or other method to answer these questions?
